TITLE VII—MISCELLANEOUS
Congress finds the following:

(1) The abuse of heroin and prescription opioid painkillers is having a devastating effect on public health and safety in communities across the United States. According to the Centers for Disease Control and Prevention, drug overdose deaths now surpass traffic accidents in the number of deaths caused by injury in the United States. In 2014, an average of more than 120 people in the United States died from drug overdoses every day.

(2) According to the National Institute on Drug Abuse (commonly known as “NIDA”), the number of prescriptions for opioids increased from approximately 76,000,000 in 1991 to nearly 207,000,000 in 2013, and the United States is the biggest consumer of opioids globally, accounting for almost 100 percent of the world total for hydrocodone and 81 percent for oxycodone.
(3) Opioid pain relievers are the most widely misused or abused controlled prescription drugs (commonly referred to as “CPDs”) and are involved in most CPD-related overdose incidents. According to the Drug Abuse Warning Network (commonly known as “DAWN”), the estimated number of emergency department visits involving nonmedical use of prescription opiates or opioids increased by 112 percent between 2006 and 2010, from 84,671 to 179,787.

(4) The use of heroin in the United States has also spiked sharply in recent years. According to the most recent National Survey on Drug Use and Health, more than 900,000 people in the United States reported using heroin in 2014, nearly a 35 percent increase from the previous year. Heroin overdose deaths more than tripled from 2010 to 2014.

(5) The supply of cheap heroin available in the United States has increased dramatically as well, largely due to the activity of Mexican drug trafficking organizations. The Drug Enforcement Administration (commonly known as the “DEA”) estimates that heroin seizures at the Mexican border have more than doubled since 2010, and heroin pro-
duction in Mexico increased 62 percent from 2013 to 2014. While only 8 percent of State and local law enforcement officials across the United States identified heroin as the greatest drug threat in their area in 2008, that number rose to 38 percent in 2015.

(6) Law enforcement officials and treatment experts throughout the country report that many people who have misused prescription opioids have turned to heroin as a cheaper or more easily obtained alternative to prescription opioids.

(7) According to a report by the National Association of State Alcohol and Drug Abuse Directors (commonly referred to as “NASADAD”), 37 States reported an increase in admissions to treatment for heroin use during the past 2 years, while admissions to treatment for prescription opiates increased 500 percent from 2000 to 2012.

(8) Research indicates that combating the opioid crisis, including abuse of prescription painkillers and, increasingly, heroin, requires a multipronged approach that involves prevention, education, monitoring, law enforcement initiatives, reducing drug diversion and the supply of illicit drugs, expanding delivery of existing treatments (including medication assisted treatments), expanding
access to overdose medications and interventions, and the development of new medications for pain that can augment the existing treatment arsenal.

(9) Substance use disorders are a treatable disease. Discoveries in the science of addiction have led to advances in the treatment of substance use disorders that help people stop abusing drugs and prescription medications and resume their productive lives.

(10) According to the National Survey on Drug Use and Health, approximately 22,700,000 people in the United States needed substance use disorder treatment in 2013, but only 2,500,000 people received it. Furthermore, current treatment services are not adequate to meet demand. According to a report commissioned by the Substance Abuse and Mental Health Services Administration (commonly known as “SAMHSA”), there are approximately 32 providers for every 1,000 individuals needing substance use disorder treatment. In some States, the ratio is much lower.

(11) The overall cost of drug abuse, from health care- and criminal justice-related costs to lost productivity, is steep, totaling more than $700,000,000,000 a year, according to NIDA. Effec-
tive substance abuse prevention can yield major eco-
nomic dividends.

(12) According to NIDA, when schools and communities properly implement science-validated substance abuse prevention programs, abuse of alcohol, tobacco, and illicit drugs is reduced. Such programs help teachers, parents, and healthcare professionals shape the perceptions of youths about the risks of drug abuse.

(13) Diverting certain individuals with substance use disorders from criminal justice systems into community-based treatment can save billions of dollars and prevent sizeable numbers of crimes, arrests, and re-incarcerations over the course of those individuals’ lives.

(14) According to the DEA, more than 2,700 tons of expired, unwanted prescription medications have been collected since the enactment of the Secure and Responsible Drug Disposal Act of 2010 (Public Law 111–273; 124 Stat. 2858).

(15) Faith-based, holistic, or drug-free models can provide a critical path to successful recovery for a number of people in the United States. The 2015 membership survey conducted by Alcoholics Anonymous (commonly known as “AA”) found that 73
percent of AA members were sober longer than 1 year and attended 2.5 meetings per week.

(16) Research shows that combining treatment medications with behavioral therapy is an effective way to facilitate success for some patients. Treatment approaches must be tailored to address the drug abuse patterns and drug-related medical, psychiatric, and social problems of each individual. Different types of medications may be useful at different stages of treatment or recovery to help a patient stop using drugs, stay in treatment, and avoid relapse. Patients have a range of options regarding their path to recovery and many have also successfully addressed drug abuse through the use of faith-based, holistic, or drug-free models.

(17) Individuals with mental illness, especially severe mental illness, are at considerably higher risk for substance abuse than the general population, and the presence of a mental illness complicates recovery from substance abuse.

(18) Rural communities are especially susceptible to heroin and opioid abuse. Individuals in rural counties have higher rates of drug poisoning deaths, including deaths from opioids. According to the American Journal of Public Health, “[O]pioid
poisonings in nonmetropolitan counties have increased at a rate greater than threefold the increase in metropolitan counties.” According to a February 19, 2016, report from the Maine Rural Health Research Center, “[M]ultiple studies document a higher prevalence [of abuse] among specific vulnerable rural populations, particularly among youth, women who are pregnant or experiencing partner violence, and persons with co-occurring disorders.”
