The PRESIDING OFFICER (Mr. Enzi). On this vote, the yeas are 57, the nays are 40. Three-fifths of the Senators duly chosen and sworn not having voted in the affirmative, the motion is rejected.

Mr. FRIST. Mr. President, I enter a motion to reconsider the vote by which cloture was not invoked.

The PRESIDING OFFICER. The motion is entered.

Mr. FRIST. Mr. President, the vote, prior to switching my vote for procedural reasons, was 58 to 39; thus, two votes short for invoking cloture. As I said just prior to the vote, America needs a comprehensive national energy policy, and we need it now. Congress has been debating this energy issue for a long time, for nearly 3 years. It is now time for us to stop talking and to deliver to the American people.

I truly believe the bill before us, that the chairman and the other members on the Energy Committee have worked so hard to produce, is a fair bill. It addresses everything from future blackouts to the whole discussion on development of a wide range of reliable energy resources. Now is the time for us to act.

I am very disappointed that we are, at this point, two votes short; that we are facing another filibuster on a very important policy for the American people. I do want to let colleagues know that this will not be the last vote that we hold. We are going to keep voting until we pass it so we get it to the President’s desk. We will have at least one more vote before we leave the early part of next week on stopping this filibuster. I don’t know when that vote will be, but we will have at least one more vote. I hope we will respond at that time by giving the American people the energy security, the economic security, and the job security that they deserve.

INTELLIGENCE AUTHORIZATION ACT FOR FISCAL YEAR 2004—CONFERENCE REPORT

Mr. FRIST. Mr. President, I now move to proceed to the consideration of H.R. 2417, the Intelligence authorization conference report. Before the Chair puts the question, this conference report has been cleared on both sides, and I hope that we can finish action on it very quickly.

The PRESIDING OFFICER. The question is on agreeing to the motion to proceed.

The Senator from Nevada.

Mr. EDWARDS. Mr. President, in response to the leader’s statement, we also believe in energy independence and the security of the Nation.

The PRESIDING OFFICER. The PRESIDING OFFICER. It is not a debatable motion.

Mr. REID. Fine. I will withhold.

The PRESIDING OFFICER. The question is on agreeing to the motion to proceed.

The motion was agreed to.

The PRESIDING OFFICER. The report will be stated.

The legislative clerk read as follows:

The Committee of Conference on the disagreeing votes of the two Houses on the bill (H.R. 2417) to authorize appropriations for fiscal year 2004 for intelligence and intelligence-related activities of the United States Government, the Community Management Account, and the Central Intelligence Agency Retirement and Disability System, and for other purposes, having met, have agreed that the house recede from its disagreement to the amendment of the Senate, and agree to the same with an amendment and the Senate agree to the same, signed by a majority of the conferences on the part of both Houses.

The Senate proceeded to consider the conference report.

(The conference report is printed in the House proceedings of the Record of November 19, 2003.)

Mr. FRIST. Mr. President, I am happy to yield to the distinguished assistant Democratic leader for a question.

ENERGY POLICY ACT

Mr. REID. Mr. President, I say through the Chair to my colleagues, we also believe in energy independence. We also believe in the security of this Nation. This was a bipartisan vote that just took place. I think we would all be well advised, this late in the session, to recognize that we should take this bill back to the committee, conference, if necessary, but I suspect it would be better off going back to committee and coming up with a different piece of legislation. People over here want badly to have a bill. The 58 votes we have are firm votes. It would not be advisable to have a vote on a Friday or Sunday. Cloture is not going to be invoked.

But let’s assume it were for purposes of this argument. Then we have the situation where there are hours following that debate, and I just think we should recognize where we are. The reality is, it is late in the session. We need to go to some other matters. With this vote, we did the Senate a favor, as everyone knows. There are points of order, rule XXVIII. This bill was going nowhere. We had the floor no better than rather than prolong it. It doesn’t help the Senate to prolong the inevitable. The inevitable is this bill is history. It is not going to go anywhere.

We really did the Senate a favor. Cloture was not involved. There are points of order against this bill, as we all know. There would be bipartisan votes on those matters. I think we should go on to something else. This was a very good debate. I think we should look back at this as something that is good for the Senate. I think that the tone was good, and look forward to the very important issues we have facing us, difficult issues. We have the omnibus bill. We have the important Medicare bill. I hope that we would not prolong things on this much longer because this bill, in its present form, is just not going anywhere.

The PRESIDING OFFICER. The majority leader.

Mr. FRIST. Again, to clarify for our colleagues, two votes short, as I implied in my statement. This policy is too important to the American people for us to desert. So we are going to come back. We are going to come back with another opportunity, after I talk to the Democratic leadership. And we will do that at the appropriate time.

Since the information of our colleagues, we will be going to other issues—right now, the Intelligence authorization conference report. It is likely today we will be doing Healthy Forests shortly. We have a lot of business today. Medicare will be addressed shortly. The two Houses will be addressing that today.

It may well be that we will begin to address issues such as Medicare later today and continue debate on energy today and look at both issues over the course of tomorrow.

Again, in the intervening time, we will be addressing issues such as Intelligence, Healthy Forests, and other conference reports as they come to the floor.

The PRESIDING OFFICER. The Democratic leader is recognized.

Mr. DASCHLE. Mr. President, I, too, wish to have an opportunity to comment briefly on the vote we have just taken.

Mr. President, for Senators like me, who support enactment of a comprehensive energy bill, the Senate’s failure this morning to break this filibuster was as unnecessary as it is unfortunate.

It is a classic example of insisting on precise language that we simply too much for the traffic to bear.

The Senate’s lead negotiator, Senator DOMENICI, was, I believe, prepared for the traffic to bear.

Regrettably, his best intentions were undercut by the cynical manipulations of the House Republican leadership during the conference proceedings, which cut Senator Bingaman out of the conference process and produced a product that was a far cry from the bipartisan energy bill that could attract broad bipartisan support in this body.

Regrettably, his best intentions were undercut by the cynical manipulations of the House Republican leadership during the conference proceedings, which cut Senator Bingaman out of the conference process and produced a product that was a far cry from the bipartisan energy bill that passed the Senate in July.

I am convinced that a true conference would have produced a much more balanced energy bill than that before us today.

Make no mistake, however, the overriding reason for the failure of this bill today was not what I consider to be its disturbing lack of balance between production and conservation or between promotion of fossil fuels and renewable energy sources. It was the House Republican leadership’s insistence on inclusion of retroactive liability protections for MTBE shielding MTBE producers from legal exposure.
The provision was not contained in either the House or Senate-passed energy bills. In an effort to aid a major special interest, the House Republicans wrote the provision so that it would specifically invalidate the State of New Hampshire’s lawsuit against the MTBE industry.

So it is no surprise that New Hampshire’s two Republican Senators chose to filibuster this bill.

The drive to placate a narrow special interest not only came at the expense of the Senate, it also helped the Republican Party’s own legislative strategy. I personally—on numerous occasions—warned Chairman DOMENICI, Chairman TAUSIN, and others responsible for the closely held Republican energy bill conference deliberations that inclusion of this provision threatened enactment of this legislation.

This scenario has, unfortunately, come to pass, ironically because the inclusion of MTBE liability waiver was the single factor that we can do to enact a comprehensive energy bill quickly.

My first preference would be to adopt something close to the bipartisan energy bill that passed the Senate by overwhelming bipartisan votes in the current and past Congresses under the leadership of both parties. But experience tells us that won’t happen.

While the drumbeat of recriminations about who bears responsibility for this setback had begun even before the vote, the question I am concerned about is that we can do to enact a comprehensive energy bill quickly.

My first preference would be to adopt something close to the bipartisan energy bill that passed the Senate by overwhelming bipartisan votes in the current and past Congresses under the leadership of both parties. But experience tells us that won’t happen.

While I fully appreciate that the current bill without MTBE liability relief would still be objectionable to many Senators, there should be no doubt that if this provision was not included, the bill would pass the Senate today and be enacted into law.

Therefore, Mr. President, I call on the White House, and the House and Senate Republican leadership, to join with me to immediately strip out the language for ethanol as well as part of the Omnibus Appropriations Act. This conference report tipped the studied balance of the Senate bill drastically in favor of short-term business interests. Regrettably, I am not surprised by the sweeping changes made to the Senate conference report was prepared by the Republican leadership behind closed doors, without the participation of their Democratic counterparts. Under these circumstances, one cannot be surprised that balance was lost, and a flawed conference report emerged.

Upon review of the bill, I was initially pleased to note its positive aspects. My completed review of the conference report, however, revealed that these few beneficial provisions were far outweighed by items injurious to the American people as a whole. The conference report erodes the careful web of environmental protections that safeguard the public health and our natural resources. It promotes an industry by falling both to encourage the development of alternate fuel sources and energy efficient technologies, and does nothing to police the energy industry to prevent a recurrence of the Enron debacle. Finally, the conference report does not include the broad, effective prohibitions against price gouging schemes used by Enron and other energy trading firms, included in the Senate version of the Energy bill.

As science has helped to illuminate the negative impacts of environmental pollutants on public health, Congress has responded by enacting a series of statutory protections designed to safeguard the American people by restricting the contaminants that enter our environment. The conference report substantially undermines these protections.

For example, the report would exempt three major metropolitan areas from meeting the Clean Air Act’s ozone-smog standard. While industry in these areas may enjoy a respite as a result of the conference report, people with asthma and other respiratory diseases will not. Moreover, it should be noted that this provision appeared for the first time in the conference report, and was never debated by the Senate or the House. Without such debate, my colleagues and I are unable to judge whether there are any mitigating factors that might justify a rollback of the Clean Air Act in these three cases.

Of direct concern to my home state of Hawaii is the treatment of methyl tertiary butyl ether, MTBE, and products containing this combustion engine additive. As a fuel additive, MTBE helps gasoline to burn more cleanly, but outside of our gas tanks, MTBE is a proven cancer causing agent that has contaminated groundwater supplies across the country. In Hawaii alone, there are approximately 500 known contamination sites, and in a state completely dependent on its isolated groundwater, this is an alarming statistic. Under this conference report, the State and citizens will have no recourse against the producers of MTBE for the expensive process of environmental cleanup, including the remediation and clean up of contaminated soil, water supplies and wells.

The conference report also exempts all construction activities at oil and gas drilling sites from coverage under the Clean Water Act. It goes further and completely removes hydraulic fracturing—an underground oil and gas recovery method from coverage under the Safe Drinking Water Act. Domestic oil and gas production contributes significantly to the short-term security of our national energy infrastructure, but I do not believe that our security interests outweigh our health interests. Nor do I believe that fossil fuel sources can ever provide a long-term solution to our energy security.

As a further blow to ongoing efforts to reduce our nation’s dependence on conventional fuels, the Republican conference dropped Senate-passed provisions that would have encouraged further research, development, and demonstrations of hydrogen fuel resources, for which Hawaii is rapidly developing a keen expertise. The measure also eliminated the broadly-supported goals for introduction of hydrogen fuel cell vehicles.

I support strong renewable portfolio standards, RPS, that provide incentives for producing renewable energy in this country. These measures—such as RPS for electricity, requirements for use in cars and trucks, and history has proven the strength of this approach. With the volatility of international fossil fuel sources, and the decline of the worldwide stock of this resource, strong CAFÉ standards are more important than ever. By introducing a variety of new and difficult criteria for the administrative development of CAFÉ standards, I believe that strong CAFÉ standards drive the development and implementation of fuel efficient technologies for use in cars and trucks, and history has proven the strength of this approach. With the volatility of international fossil fuel sources, and the decline of the worldwide stock of this resource, strong CAFÉ standards are more important than ever. By introducing a variety of new and difficult criteria for the administrative development of CAFÉ standards, it will prove difficult or impossible for any President to strengthen the current set of standards before being halted by industry lawsuits.

As a Senator from an island state, I also am concerned about provisions that seek to weaken the laws that protect our coastlines such as the Coastal Zone Management Act, CZMA. For example, the conference report shortens...
the time within which states can appeal state consistency review determinations made by the Secretary of Commerce, thus limiting the rights of states under the CZMA.

The conference report also jeopardizes reservation lands by allowing the Secretary of Energy to determine the siting of transmission lines through certain national forests and national monuments—even over the objections of the Federal agency charged with maintaining and preserving these areas.

Mr. President, I must also express my serious concern with regard to the provisions of H.R. 6 as they relate to the development of energy resources on Indian lands and the impact of these provisions on the United States trust responsibility for Indian lands and resources. To allow this bill to be passed without amendment, would, in my view, alter the bedrock principles upon which relations between the United States and the Indian nations are founded.

The United States trust responsibility is perhaps the most fundamental principle of Federal Indian law. It was first enunciated in 1832 by United States Supreme Court Chief Justice Marshall. It is the polestar which has guided the course of dealings between the Indian tribes and the United States over the last two centuries.

The United States trust responsibility for Indian lands and resources is derived from treaties and agreements between the Indian nations and the United States, statutes, executive orders, court rulings, and regulations. The Congress has legislated on this basis. The Federal courts have ruled on that basis, and the Executive branch has premised policy on this basis and promulgated regulations based upon this fundamental principle of Federal Indian law.

The Federal Government’s trust responsibility for Indian lands and resources is based on the fact that the United States holds legal title to lands that are held in trust for Indian tribal governments. As the principal agent of the United States as trustee for Indian lands and resources, under current law, the Secretary of the Interior must authorize and approve any activities affecting Indian lands and trust assets.

However, recently the United States Supreme Court in the United States v. Navajo Nation case that tribal governments may not hold the Secretary of the Interior accountable for mismanaging trust assets except if there is a specific authorization contained in a Federal statute. As a result of this ruling, tribal governments are looking to the Congress to protect longstanding principles of established trust law and to clarify with certainty the meaning of the trust responsibility after the Court’s pronouncement in the Navajo Nation case.

The Indian provisions of H.R. 6 unfortunately fail to provide a means for tribal governments to call upon the United States, as trustee for Indian lands and resources, to assist them in remedying any damages incurred to tribal lands, nor do they establish express statutory standards for the administration of the U.S. trust responsibility.

The bill requires that any tribe attempting to avail itself of the powers to regulate and develop its own energy resources must waive its rights to seek any recourse against the Secretary of the Interior. This requirement signals that it comes from existing law, and tribal governments across the country have expressed serious concern that this bill will erode the United States’ trust responsibility, especially in the aftermath of the Supreme Court’s ruling in the Navajo Nation case.

As tribal governments seek to further their rights to self-determination in new areas, such as the leases, agreements, and rights-of-way affecting tribal lands, and resources caused by other parties, the tribes will have the full force of the United States government to assist them in securing redress for such harm.

With this end in mind, I respectfully suggested that those standards applicable under the Indian Self-Determination Act be incorporated into this bill, such as the annual trust asset evaluation that is authorized in that act to be conducted by the Secretary of the Interior as a condition of the Secretary’s approval of a tribal government’s right to enter into leases, business agreements, and rights-of-way without the Secretary’s approval.

Unfortunately, this language was not adopted, and instead the bill provides that the Secretary will have the discretion to determine the manner in which trust resources will be managed, and what, if any, ongoing oversight there will be as tribal governments move into an arena that is associated with serious financial and environmental risks.

In addition, in the wake of the Supreme Court’s ruling in the Navajo Nation case, the absence of expressly-stated statutory standards for the administration of the government’s trust responsibilities as they relate to the development of energy resources on Indian lands is, I believe, a further derogation of the trust relationship that cannot be overstated.

In another section of the bill, state and tribal governments are effectively excluded from the process by which conditions for the operation of hydro-electric power projects are established, and as a result, the protection of fish and wildlife resources is left up to those for whom the financial incentives to reduce costs at the expense of the survival of fish and wildlife resources are great.

There are many in Indian country who share these concerns, and would perhaps express them more strongly than I have been able to do. We do not have a record of which we can be proud when it comes to our dealings with the first citizens of this land, and I fear that this measure will not mark a new, more constructive direction in Federal-Indian relations.

Mr. President, two men involved in the process of bringing this conference report to the floor for a vote—Senator PETE DOMENICI and Senator TED STEVENS—are very dear to me and I have the honor of working with them on a daily basis. I hope they will understand that, as much as I would like to support them and their interests, I must oppose this conference report.

ETHANOL SUBSIDY

Mr. BAUCUS. Mr. President, for several years now I have worked with the highway community in both the Highway Trust Fund with respect to the ethanol subsidy. While it is good agriculture and energy policy to encourage alternative fuels, it should not be the Highway Trust Fund, and therefore the Nation’s transportation system, that bears the burden of the ethanol subsidy.

A few years ago I introduced a bill that transferred revenue from the general fund to the Trust Fund so it could be the general fund that would bear the responsibility rather than the Trust Fund.

This Congress, Senator GRASSLEY and I introduced a bill, S. 1548, that replaced the ethanol credit with a credit and that transferred the 2.5 cents, currently retained by the general fund to the Highway Trust Fund. Although other provisions in S. 1548 are contained in the energy bill conference agreement, the new ethanol credit, the provisions most important to me did not make it in.

I appreciate your commitment and that of Speaker HASTERT and Ways and Means Chairman THOMAS to ensure that the provisions in S. 1548, regarding the Highway Trust Fund will be enacted no later than February 29, 2004 which is the day that the TEA 21 extension expires.

In fact, Speaker HASTERT sent out a press release today that confirms his commitment to enacting these important provisions from S. 1548.

I thank Senator FRIST for working with me to ensure that the Highway Trust Fund will receive all the taxes due to it and that our Nation’s transportation program will thrive.

Mr. FRIST. Mr. President, I extend my gratitude to Senator BAUCUS for working together with the Vice President, the Speaker of the House and myself to reach a compromise on the ethanol issue in the energy bill conference
agreement. We understand this is a very important issue to him and to the country and his efforts on this matter have been crucial to developing a strong energy policy.

As per the agreement, I would like to reiterate our commitment regarding the portions of the ethanol issue which are not currently in the conference agreement. In the next highway bill, we will make certain that the 2.5 cents that go into the General Fund, as well as the proceeds from repealing the 5.2 cents from the ethanol tax exemption, are credited to the Highway Trust Fund. Moreover, it would be my desire to hold the Highway Trust Fund harmless with respect to this late date of enactment.

Once again, I thank Mr. BAUCUS for working closely with us to resolve this very important issue. We look forward to enacting these provisions.

Mr. COCHRAN. Mr. President, there are several provisions in this conference report that amend the Commodity Exchange Act, which is administered by the Commodity Futures Trading Commission.

I appreciate the Energy Committee's consultation with the Agriculture Committee with respect to the amendments to the Commodity Exchange Act.

The most important change to the act is to the CFTC's antifraud authority in section 4b, which is found in section 33 of the conference report. Section 4b is the CFTC's main antifraud weapon established in 2000. The U.S. Court of Appeals for the Seventh Circuit ruled in Commodity Trend Service, Inc. v. CFTC, 233 F.3d 981, 992 (7th Cir. 2000) that the CFTC could only use section 4b in intermediate transactions, thus prompting this clarification. We are amending section 4b to provide the CFTC with clear antifraud authority over non-intermediated futures transactions.

Newly revised subsection 4b(2) prohibits fraud in transactions with persons that are within the CFTC's jurisdiction. This new language will make it clear that the CFTC has the authority to bring antifraud actions in off-exchange principal-to-principal futures transactions, including retail foreign currency transactions and exempt commodity transactions in energy and metals. In addition, the new section 4b also clarifies that this fraud authority applies to transactions conducted on derivatives trading facilities as well. The amendments to section 4(a) of the CEA regarding transactions currently prohibited under subparagraph (iv) are not intended to affect in any way the CFTC's historic ability to prosecute cases of indirect bucketing of orders executed on designated contract markets. See, e.g., Reddy v. CFTC, 191 F.3d 109 (2nd Cir. 1999); In re DeFrancesco, et al., CFTC Docket No. 02-09 (CFTC May 22, 2003) (Order Making Findings and Importing Violations). As to Respondent Brian Thornton.

The next important changes, or clarifications, come in section 9 of the Commodity Exchange Act that deals with CFTC's false reporting authority. These clarifications are also found in section 332 of the conference report.

In the last 12 months the CFTC has received approximately $100 million in settlements from energy trading firms that are accused of filing knowingly inaccurate reports. Despite these successes, the amendment to section 9(a)(2) has been included in the legislation in response to a recent U.S. Federal District Court decision in In re CFTC Case No. 03-23 (S.D. Tex.). In this case, the U.S. attorney brought a criminal case against an energy trader for filing false reports regarding fictitious natural gas transactions in an attempt to manipulate natural gas price indexes. The Court, recognizing that the U.S. attorney had to show intent for knowingly inaccurate reports, dismissed some of the false reporting counts because there arguably was no intent requirement for false or misleading reports. Consequently, the amendment merely clarifies and confirms the CFTC's longstanding use of section 9, as the CFTC has brought over 60 enforcement actions charging violations of its provisions, including but not limited to false reporting charges under subsection (a)(2). These amendments will permit the CFTC and U.S. Attorneys to continue to bring actions in the energy arena for acts or omissions that occurred prior to enactment. The bill expressly provides that these amendments simply restate, without substantive change, existing burden of proof provisions and existing CFTC civil enforcement authority, and do not alter any existing burden of proof or grant any new statutory authority.

The last amendment I will mention is a set of savings clauses for the Natural Gas Act or the Energy Act. These savings clauses are intended to help clarify the dividing line between the jurisdiction of the CFTC and the Federal Energy Regulatory Commission. The two savings clauses, which are virtually identical, can be found in section 332 and section 1261 of the conference report.

The savings clauses have two purposes. The first purpose is to make it clear that nothing in the Natural Gas Act or the Federal Power Act affects the market power of the CFTC with respect to accounts, agreements and transactions involving commodity futures and options. The CFTC, not FERC, has exclusive jurisdiction over commodity futures and options. This exclusive jurisdiction extends to futures and options on natural gas, electricity and other energy commodities, regardless of whether the futures or options contract goes to cash and is settled or offset in some other fashion.

The second purpose of the savings clauses is to clarify that FERC should follow the existing Commodity Exchange Act statute for requesting futures and options trading data from futures exchanges through the CFTC. Section 8 of the Act recognizes the highly sensitive nature of futures and options trading data and specifically restricts its public disclosure except in very limited circumstances. The regulatory scheme of the act ensures the confidentiality of futures and options trading data and is one of the reasons that investors have such confidence in the U.S. futures markets. FERC can and should be able to obtain futures and options trading data by directing its request to the CFTC not to a futures exchange such as the New York Mercantile Exchange. The CFTC has a long history of sharing futures and options trading data with other Federal and State regulators that agree to abide by the public disclosure restrictions found in section 8. The savings clauses assure that requests for futures and options trading data will be processed in the same way and be subject to the same protections.

I believe the clarifications to the Commodity Exchange Act included in the conference report only strengthen what is already a strong and sensible regulatory program administered by the Commodity Futures Trading Commission, and I support passage of the conference report to accompany H.R. 6, the Energy Policy Act.

Mr. CAMPBELL. Mr. President, I rise today in strong support of the energy bill conference report and urge its quick passage. I am deeply troubled by the misinformation being cast about by opponents of this bill on the Senate floor and in the press. I would like to take just a moment and distinguish some of the fact from fiction.

First, opponents of the bill have been criticizing the energy bill's electricity provisions. They have made sensationalistic allegations about Enron and the August blackout, among others, and conclude that this bill does nothing to improve our electricity grid. If opponents of this bill were to take the time to read the bill they have been so fervently criticizing, they would have reached far different conclusions.

These amendments have been desperately trying to color a good piece of legislation with known bad guys. I don't know how many times I have heard Enron thrown around, but never have those folks mentioned that this bill includes significant market transparency, consumer protection, and improved enforcement provisions. The fact: this bill improves matters.
Second, critics have criticized this bill for shielding MTBE producers from product liability lawsuits. Many of those Senators represent States that have sued MTBE producers for contaminating groundwater. On one hand, I appreciate why they object to that provision. My State of Colorado too is always a premium. However, MTBE isn't in groundwater because someone put it there. MTBE is in groundwater because underground storage tanks were made to hold gasoline with MTBE leaked.

Another fact: Congress mandated MTBE's use, requiring the oxygenate be added to gasoline to meet Clean Air Act requirements.

My friends on the other side should focus on fairness, and not just the deep pockets their trial lawyer friends are after. Fairness is the special interest opponents of the bill are so adamant on viliifying.

Opponents of the energy bill conference report have made outlandish claims that this bill does nothing for renewable energy. Again, such statements beg the question: have they bothered to read the bill? The fact of the matter is that this bill includes significant financial incentives for wind, biomass, and solar energy, and has the full support of the Solar Energy Industries Association. Further, the bill requires that 7.5 percent of the electricity purchased by the Federal Government come from renewable energy.

Opponents have criticized the Indian energy title of the bill as offensive to the environment. They claim that if Indians opt-in to the voluntary provisions, then those tribes can skirt NEPA. Without touching the prejudicial nature of that statement—the assumption that Indians would violate the law—I seriously doubt that opponents know why NEPA might apply at all. Under current law, if a tribe wanted to build an energy production facility on their own land with their own money, NEPA would not apply. NEPA only applies on Federal land or when there is some Federal action. Although some critics may like to think otherwise, Indian land is treated as their own land. In the example above, there is no Federal action.

How can we have a Nation's most disenfranchised and poverty stricken group seeks third-party funding to develop their own resources, then the Secretary of Interior must review the proposed project. This paternalistic Secretarial review, a historical construct in the law, is tantamount to Federal action triggering NEPA. Indians believe that their lands should be treated like other private land under the law.

Opponents of this bill are playing a cruel joke on Indians. On one hand, they argue that Indians should be free to exercise their right to self-determination. Yet, on the other hand they tell the poorest of the poor that they must do so without any third-party financing. It seems that opponents of this bill believe that, for Indians, self-determination may only be exercised through posing for tourist photos and making handcrafts.

This bill provides a voluntary tool that could help them to develop their own resources. This title could be a significant empowerment vehicle providing much-needed jobs and economic development.

Last, my friends on the other side have made several statements criticizing this bill's process. In part, I have to agree with them. Similar to the failed energy bill of the democratically controlled 107th Congress that never benefited from being drafted in the Energy and Natural Resources Committee, the current energy bill has reached the floor in an imperfect way. However, the fact of the matter is that the energy bill of the 108th Congress is a far reaching piece of legislation that is good for the country, good for my State of Colorado, which still relies heavily on the agricultural industry. Justice is served. It is important to note that all manner of farm groups support this bill, including the American Farm Bureau, the American Corn Growers, the National Farmers Union, and the National Cattleman's Association. Furthermore, this bill is supported by a host of labor organizations; the Brotherhood of Locomotive Engineers, the United Mine Workers, and the United Transportation Union, to name just a few.

Mr. President, the comprehensive energy bill before the Senate is a critical piece of legislation for the country. Its writers had the unenviable task to ask the questions that most in the Nation are never required to consider—where does the oil come from, and how can we meet future demand? This bill provides important answers and plans for the future. I urge its passage.

Mr. NELSON of Florida. Mr. President, I rise to oppose the energy bill. I wanted to support this bill, but the many environmentally questionable provisions and the large price tag prevent me from doing so.

This bill is not an energy policy bill. It is a special interest bill. We are at risk for a much more severely polluted environment, and the price tag may be too much.

However, the fact of the matter is that the energy bill of the 108th Congress is a far reaching piece of legislation that is good for the country, good for my State of Colorado, which still relies heavily on the agricultural industry. Justice is served. It is important to note that all manner of farm groups support this bill, including the American Farm Bureau, the American Corn Growers, the National Farmers Union, and the National Cattleman's Association. This bill is not an energy policy bill. It is a special interest bill. We are at risk for a much more severely polluted environment, and the price tag may be too much.
MTBE contamination incidents is estimated to increase three times following the widespread introduction of MTBE into Exxon gasoline.

Later the memo notes:
Any increase in potential groundwater contamination will also increase risk exposure to major incidents.

These memos were written more than 5 years before the Clean Air Act amendments passed that ushered in the widespread use of MTBE in gasoline. These documents were uncovered in lawsuits in California in which manufacturers and distributors of MTBE, the very entities immunized from product liability suits in this bill, were found guilty of irresponsibly manufacturing and distributing a product they knew would contaminate water. The jury found by “clear and convincing evidence” that these companies acted with “malice” by failing to warn customers of the almost certain environmental dangers of MTBE water contamination.

The coastal provisions of this bill are also troubling. Under section 321, of the Oil and Gas title, the Secretary of the Interior will be given broad new authorities to promulgate regulations for right-of-ways on the Outer Continental Shelf in moratorium areas. Interestingly, this provision left the Senate prohibiting these oil and gas activities in the moratorium areas, but came back allowing those projects to go forward as a result of input from the Department of Commerce as required under the Outer Continental Shelf Lands Act. Section 325 restricts the appeals process for coastal states appealing an oil or gas exploration or development plan to the Department of Commerce. The timeline put in place by this provision is even shorter than that requested by the Bush administration. Section 330 circumvents the Coastal Zone Management Act and deems the Federal Energy Regulatory Commission record the record for a Coastal Zone Management Act appeal—limiting a State’s input into the process. For these reasons, I cannot support the bill.

Mr. ENZI. Mr. President, there is an old adage we have heard many times that says that the journey of a thousand miles begins with a single step. Today we are taking another one of those steps in a long journey that will hopefully, once we have achieved energy independence, more reliable sources of energy, and more stable prices that are not so subject to fluctuations in the energy market.

The bill we have before us is something that will truly affect every American, no matter where they live, where they work, or what activities they pursue in life. One of the many things that binds us as Americans is the love of so many things that makes us consumers of energy. No matter what you are a strong and vital part of that market.

If you drive a car, you won’t get very far without a full tank of gas. If you use a computer, you have to tie it to some source of electricity to get the power you need to access the Internet or the information stored on your hard drive.

If you live in a mobile home, or in a cabin in the back country, cooking your food over an open fire, you are still an energy consumer who is using a resource to make your dinner. Every lifestyle has its own energy needs and we have been incredibly blessed to have had access to an abundance of energy for many, many years.

In fact, we had such relatively easy access to energy we started to take it for granted. That led to calls for conservation and more wise use of our resources when energy costs first started to rise. That was the start of our journey to create an energy policy—one that has seen us through these past years. Unfortunately, it has taken quite a long time to agree on an update to our policy, one that takes into consideration the impact that is seen in our society and in the availability of energy both here and abroad.

Our dependence on foreign sources of energy continues to be a national concern, one that had me and many others calling for renewal of a national energy policy, which we have done since 1973 when OPEC and the Saudi Arabsians first pulled the plug on our supply of crude oil.

The irony was the fact that we had an abundance of oil here in the United States at the time. In fact, we still have a huge supply of oil in the country today, but that oil has not been made available for exploration. Because we hadn’t taken the steps to develop it, we allowed a foreign government to disrupt and control part of our daily lives. We became vulnerable to their manipulations and it took us months to recover. In some ways, we are continuing to recover from those days on the long gas lines, high prices and short supplies that we saw in the 1970s.

Things were bad enough back then when we didn’t have an energy policy. Still, they could have been much worse. I shudder to think what might have happened if we’d had a situation like 9/11 occur at the heart of that crisis. If the terrorists had struck when we were economically crippled and energy supplies were low, what effect could they have had on our national security?

That kind of scenario is exactly the kind of thing that a national energy policy like the one we are taking up today is supposed to avoid.

It has taken us quite a while to get where we are, but we finally have something before us that will provide us with a plan, a blueprint for the future that will also address our needs in the present. It is time now for us to take it off the planning board and put it in the very real world. We’ve got to be enough time to put the basics of a plan together, and that is how long we have had since the energy crisis of the 1970s to work out a plan like this. Now we have before us the beginning of what will be a long and continuing effort to stabilize our energy markets and protect our national security.

This bill isn’t perfect, but it is a good start. It is more than a temporary remedy that will start producing results immediately while it lets us continue working on a more permanent solution. In other words, it is a chance to grab the brass ring and get another ride on the energy merry-go-round, while providing for the ride we are currently on.

I am pleased that this bill includes a number of important provisions that support and promote clean coal development. Coal is an important product of Wyoming, and one of the most important ways we can reduce our dependence on foreign energy is to find ways to diversify our energy supplies and better utilize our Nation’s abundant coal resources.

In addition to our coal supplies, in recent years our new energy development has focused on the increased use of wind and solar energy. I am pleased that this bill includes provisions that encourage wind and solar energy development and I hope that our coal industry continues to grow and flourish. I am also keenly aware of the fact that there isn’t enough natural gas or infrastructure available to support the amount of energy needs so we are going to have to continue relying on coal for some of our energy uses.

That does not mean we have to continue doing business as usual and continue to push our aging coal-fired power plants well beyond their originally designed lifetimes. We have the technology and the ability to design and build cleaner and more efficient power plants that utilize new clean coal technology, but we won’t be able to do it if we cripple our economy and prohibit new development.

This won’t surprise anyone, but none of us are going to be enthusiastic about everything in this bill. Again, it is not a perfect bill, but it is a good start on a policy. It does not have everything I want in it, but it does have more than enough to make it worth our support. There is a provision that would have greatly helped Wyoming get the more than $400 million that it is owed by the Federal Government through the Abandoned Mine Lands Trust Fund, but that provision was not included in this bill.

We have received assurances from the Finance and Energy Committees that they would take up this matter early next year, and we are grateful for their assistance. However, I would have preferred that the provision had been included in this bill and we didn’t have to take up any of the committee’s time next year. Still, again, on balance, and taking the whole bill into consideration, it is a good bill and it deserves our support.

I know I am not the only one who feels that one provision or another
could have been added or left out and it would have made for a better bill. Like me, almost every State can point at something that they wish could have been included but was not. It is a reason to be disappointed, but it's not a reason to ignore the task at hand, which is to continue the process and develop a national energy policy.

There are just too many positive things that the bill would do for the country in the long and short term. To begin with, the bill would create nearly 1 million jobs and improve the country's energy independence, conservation, and development for new technologies, energy efficiency and clean technologies, to research and alternative fuel vehicles and alternative energy sources.

It addresses everything from energy efficiency and conservation, to research and development for new technologies, to policies to encourage a wide variety of energy sources nationwide. People will always find something to criticize in a sweeping piece of legislation, but we need to focus on the huge accomplishments this bill will achieve.

We will advance cutting-edge technologies such as hydrogen fuel cells and improve clean technologies already in use, including hydro, wind, and solar energy. At the same time we will shore up our own domestic production of the resources we use most, including clean coal, oil, and natural gas. We will begin to use 5 billion gallons of ethanol and biodiesel annually as a result of this bill, and that is a very good thing for farmers and consumers across America. Reforms in the electricity title will result in more reliable service and more investment in the backbone of our electricity infrastructure.

I would especially like to acknowledge Senator Domenici's wise counsel in regard to an amendment I had intended to propose to enhance the economic growth of western States. My amendment would have provided for the study and creation of National Interest Electric Transmission Corridors by the Secretary of Energy, based on national security and energy policy grounds. Pursuant to those designations, the bill would have provided for the development of needed electric transmission lines would be provided for. While most of this additional capacity would probably be achieved by broadening existing rights-of-way, there would no doubt be some additional rights-of-way. Upon the advice of the chairman and his assurance that he would pursue these concepts, I declined to offer that amendment on the Senate floor.

I am very encouraged that the chairman has been successful in having the concept of National Interest Electric Transmission Corridors included in the bill, for any area experiencing electric energy transmission constraints or congestion. Transmission capacity in the West is one of the significant issues regarding their future economic expansion. Furthermore, if we could unlock the tremendous coal, wind and other resources of these States through mine-mouth electric generation and provide for the transmission of that electricity to load centers it would take significant pressure off our increasing reliance on natural gas as a power source. This is one of the keys to a balanced energy portfolio and lessened reliance on foreign energy sources.

Mr. Burns. Mr. President, I would like to commend the chairman of the Energy Committee for his leadership on the bill both on the Senate floor and through the conference. This is the first comprehensive energy legislation this country has seen in more than a decade, and it is a huge step forward for America. This energy bill is about looking forward to our future, and creating the energy and the jobs that will keep this country best in the world.

This is a large and complicated bill. It addresses everything from energy efficiency and conservation, to research and development for new technologies, and policies to encourage a wide variety of energy sources nationwide. People will always find something to criticize in a sweeping piece of legislation, but we need to focus on the huge accomplishments this bill will achieve.

We will advance cutting-edge technologies such as hydrogen fuel cells and improve clean technologies already in use, including hydro, wind, and solar energy. At the same time we will shore up our own domestic production of the resources we use most, including clean coal, oil, and natural gas. We will begin to use 5 billion gallons of ethanol and biodiesel annually as a result of this bill, and that is a very good thing for farmers and consumers across America. Reforms in the electricity title will result in more reliable service and more investment in the backbone of our electricity infrastructure.

I would especially like to acknowledge Senator Domenici's wise counsel in regard to an amendment I had intended to propose to enhance the economic growth of western States. My amendment would have provided for the study and creation of National Interest Electric Transmission Corridors by the Secretary of Energy, based on national security and energy policy grounds. Pursuant to those designations, the bill would have provided for the development of needed electric transmission lines would be provided for. While most of this additional capacity would probably be achieved by broadening existing rights-of-way, there would no doubt be some additional rights-of-way. Upon the advice of the chairman and his assurance that he would pursue these concepts, I declined to offer that amendment on the Senate floor.

I am very encouraged that the chairman has been successful in having the concept of National Interest Electric Transmission Corridors included in the bill, for any area experiencing electric energy transmission constraints or congestion. Transmission capacity in the West is one of the significant issues regarding their future economic expansion. Furthermore, if we could unlock the tremendous coal, wind and other resources of these States through mine-mouth electric generation and provide for the transmission of that electricity to load centers it would take significant pressure off our increasing reliance on natural gas as a power source. This is one of the keys to a balanced energy portfolio and lessened reliance on foreign energy sources.

My home State of Montana can make a significant contribution to our Nation's energy independence, provided we can develop the needed transmission infrastructure to move electricity to market if we generate it from our coal and wind resources. This is very important for both the generating States and the end-user markets and is simply good national energy policy and good national security policy.

This energy bill isn't perfect, but it helps us transition into tomorrow's economy without sacrificing our quality of life today. It is a good balance, and a good compromise between the countless demands that have been made by those with opposing viewpoints. No one can win every battle, but without this energy legislation the entire country loses. I am disappointed in the Members of this body who would rather complain about this bill than enact it. We shouldn't let partisanship get in the way of progress, and this bill is progress. No one got all they wanted, but every State in the Union will benefit, and every American is a winner under this bill. This is this country's energy security by passing this legislation.

Mr. Hatch. Mr. President, I rise today to express my strong support for H.R. 6, the Energy Policy Act. It has been a long, long time since we could claim to have a national energy policy, and I am very proud to say that we are about to deliver an energy plan to the American people that is comprehensive and forward looking. It is a balanced approach to energy that recognizes America's need for energy independence and cleaner air.

It is no simple task to construct complex legislation of such a broad scope. A good deal of the credit for the fact that we have a conference report to the American people that is a sweepingly comprehensive, yet balanced plan goes to the leadership of Chairman Domenici and Chairman Grassley, and the respective Democratic ranking members Senator Bingaman and Senator Baucus. I congratulate our colleagues for their leadership.

And when it comes to leadership, we all know that it was President George W. Bush who first put us on the path to a national energy plan. One of the President's earliest acts was to establish the National Energy Policy Development Group, which produced the National Energy Policy Report, an early template for the legislation we have before us today.

We don't have to convince the American people that we need this energy bill. They already know. They are the ones who paid more than $2 per gallon to fill their cars this summer. They are the ones who sat in blackouts for days. And, they are the ones who have watched their natural gas bills go through the roof.

I am pleased to report to the American people that the Energy Policy Act addresses each of those problems—and more.

My State of Utah is an energy resource State. Utah has long helped to fuel our Nation's growth, whether it be by supplying the uranium that fueled our early nuclear industry, the oil and natural gas for our vehicles and homes, or the clean coal which powers our coal-fired electricity plants. Utah has also been a leader in producing renewable energy with our large hydroelectric facilities and our significant geothermal plants. Thanks to environmental protections, labor laws, and environmental regulations, our Nation is cleaner and stronger than ever before. And I am glad these protections are in place. However, the many layers
of these rules and regulations do make energy production more expensive. In Utah, where we have many millions of acres of beautiful public lands, we have the extra difficulty of developing energy while trying to preserve significant portions of these areas. In my State, we want all the protection our laws provide, but we recognize the need for assistance from the Federal Government to keep this activity going in this country. And in doing so, this legislation leaves almost no stone unturned.

The act will help us to leap forward in creating more efficient buildings and homes in this country, and it starts at home by addressing congressional and other Federal buildings. The act takes large strides forward in promoting the use of renewable energy in the United States. The bill also covers solar energy, wind energy, hydro power, and geothermal energy, the latter being particularly important in my State.

I am pleased that the Energy Policy Act includes important provisions to increase the reliability of our electricity system. We have seen what happens when we lack a reliable, affordable electricity supply; our modern society comes to a near standstill. Reliable electricity is one of the most important services we can provide our Nation. Most of the electricity produced in the United States comes from coal-fired power plants. The newer coal plants which are prevalent in the West are very clean and very efficient. This legislation promotes the most advanced technologies in this industry which will lead to further improvements in the reliability of our electricity system and in the quality of our air. The bill also provides programs to improve electricity service to our Native Americans.

Importantly, the Energy Policy Act addresses our need for a more reliable fossil fuel supply. This includes home heating oil, natural gas, and our other basic transportation fuels, petroleum and gasoline. The transportation sector in the U.S. accounts for nearly two-thirds of all oil consumption, and we are almost entirely dependent on petroleum for our transportation needs. Is it any wonder, that 50 percent of our urban smog is caused by these sources? If we are to clean our air and address our Nation’s energy dependency, we must focus on the transportation sector. And we must focus first on those technologies and alternative fuels that are already available and abundant domestically.

To that end, 14 cosponsors and I introduced S. 505, the Clean Efficient Technologies Act of 2003, or the CLEAR Act. This is the most comprehensive and effective plan we have seen in this country to accelerate the transformation of the automotive marketplace toward the widespread use of fuel cell vehicles. And it would do so without any new Federal mandates. Rather, it would offer powerful market incentives to promote the advances in technology, in our infrastructure, and in the alternative fuels that are necessary if fuel cells are to ever reach the mass market. As a result our Nation benefits from cleaner air and greater energy independence.

I am very pleased to report that a large portion of the CLEAR Act was included in the Energy Policy Act. And for that I give my heartfelt thanks to Finance Committee Chairman Grassley and Senator Baucus.

First, the bill offers CLEAR Act credits to consumers who purchase alternative fuel and advanced technology vehicles, such as hybrid-electric vehicles. These credits would lower the price gap between these cleaner and more efficient vehicles and conventionally fueledALLY-fueled vehicles of the same type. This is a direct attack on our Nation’s huge appetite for petroleum as a transportation fuel, and I am confident that the CLEAR Act credits will accelerate our shift toward a more efficient and cleaner transportation future.

When I introduced the CLEAR Act, it contained a significant tax credit for the installation costs of retail and residential refueling stations. I was disappointed when this provision was weakened in conference and replaced with a provision that extends and expands an existing tax deduction for infrastructure. However, I am pleased that an infrastructure incentive did survive the conference process. As originally introduced, the CLEAR Act also provided a very important tax credit of 50 cents per gallon-equivalent for the purchase of alternative fuel at retail. This would have brought the price of these cleaner fuels much closer in line with conventional automotive fuels and contributed significantly to the diversity of our fuel supply.

This was a very important component of the CLEAR Act that did not survive the conference process. It was important because of the combination of this incentive, the infrastructure incentive, and the alternative fuel vehicle credit working together was meant to have a larger effect on the market than could have been accomplished by providing these incentives alone at different times. For instance, the fuel credit would have combined with the vehicle credit to give an incentive to consumers to buy cleaner cars. The fuel credit also would have combined with the infrastructure credit for a very powerful incentive to install new fueling stations. The presence of more fueling stations is the key for the purchase of more clean vehicles, and so on. Because all three incentives are not in the final bill, we will not achieve the synergy that would otherwise have been possible, and the potential benefits of the CLEAR Act may not be fully realized.

In spite of this disappointment, I am very pleased that such a large portion of the CLEAR Act was included in the energy bill. I can see the day when alternative vehicle fuels, fuel cells, and other advanced car technologies will be common. And considering the environmental and security costs associated with our petroleum-based transportation system, that day cannot come too soon.

As I have outlined in my statement, the Energy Policy Act will go a long way to bringing our nation into the future. It will increase our energy security, clean our air, and achieve our colleagues’ goals and throw their support behind it.

Mr. CONRAD. Mr. President, I come to the floor today to support the energy bill conference report. I have long believed we need a comprehensive national energy policy. The reality is that our economy depends on affordable energy. We often take it for granted, but just imagine how different our daily lives would be if we did not have plentiful, affordable oil, natural gas, and electricity. We depend on energy in almost everything we do in our lives, from turning on the light in the morning, to driving our cars to work, to cooking our dinner, to watching TV at the end of the day.

And energy is absolutely critical to the functioning of our economy. Our manufacturing sector uses vast amounts of energy to produce the whole range of products we take for granted in our stores across the country. Our services sector—and particularly our high tech sector—rely on electricity. Our agriculture economy uses enormous energy inputs for planting, harvesting and processing its bountiful production. And without energy, we could not transport these goods and services to consumers.

It is virtually impossible to underestimate the importance of energy to our daily lives and to our economy. Yet our energy policy is seriously lacking. As I have outlined in my statement, the Energy Policy Act will go a long way to bringing our nation into the future. It will increase our energy security, clean our air, and achieve our colleagues’ goals and throw their support behind it.

As the blackout in the northeast demonstrated last summer, our national electricity infrastructure is decades old and dangerously overloaded. Quite simply, we have under-invested in making sure that the national electricity grid can keep up with demand for electricity. Since 1992, demand for electricity has been growing at 2.5 percent per year while transmission capacity has been growing at only .7 percent per year. At the same time, de-regulation of the electricity industry has led to a hodgepodge of control over transmission capacity, without clear rules and responsibility for maintaining the reliability of the system. We need new rules to improve the reliability of the grid and new incentives to increase transmission capacity if we’re to avoid future meltdowns.

And, we remain overly dependent on foreign oil. Oil imports now account for nearly 60 percent of consumption, and the projection is for that percentage to continue increasing inexorably. That puts our economy at risk, because it is vulnerable to price spikes caused by...
OPEC or supply disruptions in foreign trouble spots. And it creates national security challenges. We currently rely on the vast oil reserves in the Middle East to meet our import demands, and that makes ensuring the free flow of oil from that part of the world a vital national security interest. So we need an energy policy that will reduce our reliance on imported oil.

For these reasons, I have long believed we need to update our national energy policy. The bill we have before us begins to address these challenges. It will improve the reliability of our electric grid. It provides positive incentives for renewable energy. And it promotes conservation.

Let me be clear, though. This is not a perfect bill. It does not go nearly as far as I would like in addressing the issues I have outlined and other critical national energy policy. It contains several provisions that I do not think should be in an energy bill. But on balance, it is a positive step for North Dakota and the national economy, and it will create new jobs in my State.

Let me first talk about the provisions I support that will help ensure our national energy security and benefit North Dakota.

First, the bill strongly promotes the use of ethanol and other bio-fuels. The bill will require 5 billion gallons of ethanol by 2012. And it will create a bio-diesel tax credit of $1 per gallon for feedstocks such as canola and 50 cents a gallon for recycled feedstock such as restaurant grease. These are clean and renewable fuels, and these provisions are good for the environment, good for our energy independence, and good for North Dakota farmers.

Second, I am very pleased that the bill contains a provision I fought for to extend the production tax credit for wind for 3 years. North Dakota has the highest potential for wind energy of any State in the Nation. This provision will aid in the production of wind energy facilities and equipment in North Dakota. That is good for electricity consumers, good for the environment, and good for wind energy equipment manufacturing workers, and good for farmers and others who will benefit from having wind turbines on their land.

Third, the bill contains a 15 percent investment tax credit to support the development of clean coal technology that will help with North Dakota's lignite coal industry. We have a thriving lignite coal industry in North Dakota, with seven lignite plants that use 30 million tons of lignite each year. And jobs in the lignite industry are among the highest paying jobs in my State.

Fourth, the bill contains incentives for adding pollution control equipment on older coal plants and incentives for building new, more environmentally friendly coal plants. This could be a big help in getting a new lignite plant in western North Dakota while maintaining our pristine environment, something I have been working on for years.

Fifth, the bill contains modest steps to promote energy conservation, including a tax credit of up to $2000 to encourage people to better insulate their homes, and provisions to encourage the purchase and use of more energy efficient appliances.

Sixth, there are provisions to encourage small producers of oil and gas. Many people do not think of North Dakota as an oil and State, but we have significant reserves that can be tapped to help reduce our dependence on foreign oil and address the shortage of domestic natural gas production. The bill includes a tax credit for marginal wells, provisions to speed up permitting on Federal lands, and a section to encourage a particularly important process for natural gas extraction.

Seventh, the bill includes a set of provisions to improve the reliability of the national electric transmission grid, reducing the chances of a massive failure like the one that affected the northeast last summer.

Eighth, the electricity title also ensures that small cooperatives will not be subject to burdensome FERC jurisdiction. It reduces our dependence on foreign oil and address the shortage of domestic natural gas production. The bill includes a tax credit for marginal wells, provisions to speed up permitting on Federal lands, and a section to encourage a particularly important process for natural gas extraction.

Finally, the electricity title also contains provisions that small cooperatives will not be subject to burdensome FERC jurisdiction. It reduces our dependence on foreign oil and address the shortage of domestic natural gas production. The bill includes a tax credit for marginal wells, provisions to speed up permitting on Federal lands, and a section to encourage a particularly important process for natural gas extraction.

Because of all these important provisions, a number of North Dakota groups support the bill. These include the North Dakota Farmers Union, the North Dakota Farm Bureau, the North Dakota Rural Electric Cooperative Association, the Lignite Energy Council, and the Greater North Dakota Association.

As I said earlier, however, this bill is far from perfect. There are a number of areas where it could and should have been much better.

For example, the conference report does not contain a Renewable Portfolio Standard. The bill that passed the Senate required that 10 percent of electricity be produced from renewable energy sources by 2020. This modest RPS has done much to protect the environment and spurred wind energy development. I supported this provision and wish it had been included in the conference report.

More generally, the conference report falls short on promoting the use of renewable fuels and emphasizing conservation. If we are ever to overcome our dependence on foreign oil imports, we will need to be more aggressive on these fronts.

I am also disappointed that the bill does not contain tradeable tax credits to encourage cooperatives and municipal utilities to further invest in renewable energy sources. Tradeable credits would have leveled the playing field for these electric utilities as we build wind farms and other renewable energy facilities. The conference report could and should have included this provision.

And I do not believe the conference report goes nearly far enough in creating new incentives for expanding transmission capacity to reduce the risk of blackouts. I had hoped the conference report would contain provisions to eliminate the transmission bottleneck that is preventing my state from expanding lignite and wind energy plants to export more electricity to regional markets. Here again, the conference report could and should have done more.

Finally, the bill contains a number of unnecessary provisions that I do not support. The liability waiver for the distributor of fuel known as MTBE—or methyl tertiary butyl ether—is troubling. Clean Air Act changes that will allow certain cities to postpone compliance with reductions in ozone damaging pollutants is something I am hoping to do with promoting sound energy policy and should not be in the bill.

I believe we have more work to do to produce a truly comprehensive energy policy that addresses our energy, economic, and national security challenges. In particular, I will continue to push for an expansion of transmission capacity to protect against the failure of our electricity grid and allow North Dakota to increase its exports of electricity. It is my hope that we will be able to work on these issues in a bipartisan manner.

Despite its shortcomings, on balance the bill before us takes positive steps to address our Nation's energy needs. It will encourage domestic energy production, promote renewable fuels, and modestly encourage conservation to help reduce our reliance on foreign oil. It will help to reduce the likelihood of major transmission breakdowns.

And it will provide significant benefits to my State of North Dakota. Energy is the second largest sector of the North Dakota economy, and it will benefit very directly from a number of provisions in the bill. And agriculture, the largest sector of the North Dakota economy, will also see important benefits from the various renewable fuel incentives.

For those reasons, I support the conference report.

Mrs. LINCOLN. Mr. President, I rise today to announce my support for the Energy Policy Act of 2003. I want to thank Chairmen GRASSLEY and DOMENICI and Senators BAUCUS and BINGAMAN for working with me to include renewable energy and energy efficiency provisions important to my home State of Arkansas. While some may say this bill is not perfect, it is a step toward reducing our dependence on foreign oil and...
increasing the use of renewable resources in this country.

Nine months ago, I stood before this body and spoke on the dangers of continued reliance on foreign sources of energy. Today, I am pleased to stand here in support of a bill that many, many years were excluded from the drafting of this bill.

But I am pleased that those who did draft this bill made an effort to address energy concerns in every sector of this industry. In Arkansas, we have investor owned utilities and co-operatives. This bill will help both of these providers serve their customers in a more efficient and reliable manner. And while this bill may not go as far as some would like in the direction of renewable energy, there are many provisions in this package which will help the United States begin the long process of eliminating our dependence on foreign oil. I believe the renewable fuel standard, requiring our government to purchase a certain percent of its energy from renewable sources, represents a positive step toward this goal. I personally fought to include provisions that will encourage greater use of renewable resources, increased production of energy, and greater investment in delivering fuels to rural America.

In Arkansas, we recognize the importance of renewable fuels in helping the United States to become more energy-independent. That's why I am excited about the provisions in this bill that will encourage greater use of a valuable new alternative fuel, biodiesel. Biodiesel, which can be made from just about any agricultural oil, including oils from cottonseed, can be completely renewable, contains no petroleum, and can be easily blended with petroleum diesel. It can be added directly into the gas tank of a compression-ignition, diesel engine vehicle with no major modifications. Biodiesel is completely biodegradable and non-toxic, contains no sulfur, and it is the first and only alternative fuel to meet EPA's Tier I and II health effects testing standards. Biodiesel also stands ready to reach the EPA's new rule to reduce the sulfur content of highway diesel fuel by over 95 percent. These tax credits are necessary as biodiesel is not yet cost-competitive with petroleum diesel.

The final provision I would like to discuss as we draft an energy bill for consideration in this Congress. This legislation will provide a partial exemption from the diesel excise tax for diesel blended with biodiesel. Specifically, the bill provides a one-cent reduction in the biodiesel excise tax from virgin agricultural oils blended with diesel up to 20 percent. The legislation will also provide a half-cent reduction for every percent of biodiesel from recycled agricultural oils and animal fats. With today's depressed market for farm commodities, biodiesel will serve as a ready new market for surplus farm products. Investment now in the biodiesel industry will level the playing field and create new opportunities in rural America. This bill also contains a provision I fought for that will provide a tax credit for production of fuels from animal and agricultural waste.

Thanks to new technological developments, we can now produce significant quantities of alternative fuels from agricultural and animal wastes in an environmentally-friendly manner. The production incentives included in this bill will assure implementation and commercialization of this new generation of technology. I am also pleased this bill includes language to encourage additional collection and productive use of methane gas generated by garbage decomposing in American waste to energy facilities. This is a renewable fuel that can be used directly as an energy source for heating, as a clean burning vehicle fuel, and as a hydrogen source for fuel cells. Furthermore, it can power generators to produce electricity. There are compelling environmental reasons to encourage these projects.

Even the large landfills that are required under the Clean Air Act to collect their gas and control non-methane organic compounds find it more cost-effective to simply flare or otherwise waste the gas rather than use the methane to produce electricity. Some smaller landfills are not required to collect the gas, and may continue to emit it for decades under the Clean Air Act. Thus, landfill gas projects will not only reduce local and regional air pollution while yielding a renewable source of energy, they will also reduce the country's yearly emissions of greenhouse gases by a very substantial amount.

I also worked to include a provision that will encourage new waste-to-energy facilities to produce electricity directly from the combustion of our trash. Arkansas stands with other environmentally conscious States in understanding that waste-to-energy technology saves valuable land and significantly reduces the amount of greenhouse gases that would have been released into our atmosphere without its operation. The volume of waste generated and electricity produced can be reduced by greater than 90 percent by utilizing waste-to-energy facilities, and EPA has confirmed that more than 33 million tons of greenhouse gases can be avoided annually by the combustion of municipal solid waste. Municipal solid waste is a sustainable source of clean, renewable energy and I am proud to see this measure enacted into law.

Another provision of which I am particularly proud relates to the clean-up of Southwest Experimental Fast Oxide Reactor, a decommissioned nuclear reactor near the community of Stricker, Arkansas, in the northwest corner of the state. The site is contaminated with residual radiation, liquid sodium, lead, asbestos, mercury, PCBs, and other environmental contaminants and explosive chemicals. I have been fighting to rehabilitate this site since I came to the Senate, and now we know that persistence pays off. SEFOR was built by the Southwest Atomic Energy Associates, a consortium of investor-owned electric utilities, and the U.S. Atomic Energy Commission to test liquid metal fast breeder reactor fuel. SEFOR began operations in 1969 and was permanently shut down in 1972. After the reactor's useful life, the ownership of the site was transferred to the University of Arkansas. The Federal Government helped create these contaminants, and therefore should pay to help clean them up. This is great news for northwest Arkansas, because this site has threatened public health and the environment in one of our most beautiful areas for too long. I thank the conferees for retaining my provision related to cleaning up this site.

The final provision I would like to praise relates to improving our country's natural gas infrastructure. I am proud that this bill contains provisions to make it easier for natural gas companies to deliver clean-burning natural gas to this Nation's rural homes, by decreasing the depreciation time for natural gas pipelines.

America's demand for energy is expected to grow by 32 percent during the next 20 years and consumer demand for natural gas will grow at almost twice that rate, due to its economic, environmental, and operational benefits. That level of natural gas use is almost 60 percent greater than the highest recorded level. To satisfy this projected demand, we must substantially expand our existing gas infrastructure and this provision will do that. These provisions are extremely proud of, but there are also provisions in this bill that I am not proud of. I am very disappointed by the way in which the
issue of MTBE liability is handled in this bill. I am also disappointed by the lack of a renewable portfolio standard in this bill and I will continue to work to see that a RPS is enacted in coming years.

Our current global situation shows us just how important it is that we take steps to reduce our dependence on foreign oil. I hope that this bill is taken for what it is: not a comprehensive solution, but a certain step in the right direction. More work needs to be done if we ever expect this country to lose its dependence on fossil fuel and foreign sources of energy and I urge my colleagues to continue to work hard until we achieve this goal.

Mr. BIDEN. Mr. President, for our national security, for our economic future, for the health of our environment, our country needs an effective, comprehensive national energy policy. We must free ourselves from dependence on foreign sources of energy. We must make costly investments in energy practices and invest in cutting-edge technologies that will keep our economy the most productive in the world. And we must protect and heal the natural environment that we will leave for our children and grandchildren.

The legislation before us fails to meet those needs. When I, and 83 other Senators, voted for the Energy Policy Act on July 31, it was very a different piece of legislation. Unfortunately, the bill has been drastically changed since then. Without sufficient discussion and input from our side of the aisle, unacceptable parts were added to this legislation and crucial parts were taken away. We have been left with a boated symbol of lost opportunity. I cannot support it.

This is not a trivial matter. This bill would set our energy policy for the next 10 years; we must get it right. Consider how things have changed since we last enacted an energy policy in 1992 and what new challenges we will face in the next 10 years.

Cracks in our energy policy, both in infrastructure and regulation, have become evident in the last few years. They have been most clearly shown during the Enron scandal and the August blackout in the Northeast and Midwest. These were clear signals of serious problems in the current system. Unfortunately, they have not been addressed by the black out, and it cost New York City alone $1 billion. This should have been a call to action, but it was not. This bill fails to address the weaknesses in our electrical grid that were exposed over the summer.

The Federal Energy Regulation Commission is prohibited in this bill, until 2007, from reforming the national power grid through mandating Regional Transmission Organizations, which we all know are necessary to ensure that further blackouts don’t occur. This legislation also requires those who want to construct a Regional Transmission Organization to foot the full bill themselves, basically guaranteeing that it won’t happen. I have received complaints from the Public Service Commission in Delaware on this very provision.

As our colleagues from the West Coast have so clearly shown, Enron-style energy market manipulation was a major force in undermining the energy system in that part of the country. But this bill does not close the loopholes, with cute names like “Get Shorty,” that allowed Enron to inflate their profits, and that directly caused some of the disruptive and costly power shortages. The bill also rescinds the Public Utility Holding Company Act without providing an adequate replacement. PUHCA has for decades protected energy customers from energy corporations, like Enron, who might undertake predatory actions or make risky acquisitions or mergers. The repeal of this legislation leaves consumers held hostage if a power company loses its money on a non-energy investment. They could just put it on their customers’ electric bills.

Not only does this bill not address the problems of the past, it doesn’t have the pieces to create a framework to solve future problems. Our reliance on oil and gas today is inescapable, but the need to move toward something better is undeniable. We will invest billions of taxpayer dollars in this bill for a resource that can’t possibly sustain us. Our dependence on oil ties us to international politics of unstable countries around the world. It condemns us to unsustainable levels of pollution. It should not be a very radical idea to suggest that we need to shift the type of energy that we use in this country. We consume almost 25 percent of the world’s daily production of oil, though we hold only 3 percent of the world’s oil reserves. This is a deficit that we will pay for with lack of control over the air we breathe, and non-compliance has been linked to an increased occurrence of respiratory problems. A group of health organizations including Physicians for Social Responsibility and the American Lung Association have estimated that this rollback would cause more than 385,000 asthma attacks and nearly 5,000 hospital admissions per year.

The Clean Water Act has likewise been weakened. Oil and gas drilling sites are exempted in this bill from run-off compliance, and hydraulic fracturing, an oil and gas recovery technique, has been completely removed from regulation under the Safe Drinking Water Act.

There are two major changes, but there are other assaults on the environment. For instance, royalties charged to oil and gas recovery units on public land were reduced; offshore oil drilling in the Outer Continental Shelf was authorized; and, a Senate-approved provision, authorizing research on global climate change, was eliminated. This bill prefers ignorance to understanding when it comes to the most important environmental issues that our planet faces today.

And, in perhaps the most transparent concession to special interests, this bill not only waives liability, retroactively to September 5, for those who have produced the toxic substance, MTBE, that is polluting our ground water supply, but it grants its manufacturers $2 billion in transition funds and doesn’t ban the additive until 2014, a provision which can be easily waived by the President or any Governor. This leaves those affected communities with a $25 billion,
mostly in pork, almost half in back-
ward-looking tax breaks to fossil fuel
producers. That is simply too much to be
spent on a bad idea. This is not a
roadmap, a vision on the horizon, to
guide us for the next decade.

The only way to give us the com-
prehensive energy policy our Nation
needs in this new century. It does noth-
ing to free us from our dangerous de-
pendence on fossil fuels. It does not set
a clear course toward cleaner, more ef-
ficient technologies. And it fails to
protect our environment. In two ways
it has sacrificed the long-term in-
terests that we all share for short-
sighted special interests. We can, we
must do better.

Mr. KOHL. Mr. President I regret
having to vote against this energy
package. The country needs a coherent
energy policy to help us tackle the
challenges that come with economic
growth. Our constituents need to know
that when they wake up in the morn-
ing, the lights will be on and the en-
ergy to power our days will be avail-
able.

Our economy needs plentiful, afford-
able, reliable energy as we struggle to
climb out of a devastating period of slow
job loss. Unfortunately, this bill does more to meet
the needs of special interests than the
needs of a growing economy.

We need an energy bill that leads to
lower prices, a clean environment, and
consumers. The bill before us today is a missed opportu-
ity to further any of those goals. It has come up short in its effort to lower natural gas
prices for Wisconsin consumers. Nat-
ural gas prices have been a roller coaster
for the people from my State, and we
need a large long term supply to
come on line. The North Slope of Alas-
ka was the answer, but this bill has done little to make that supply a re-
ality.

Another problem plaguing consumers in Wisconsin is spikes in gas prices
brought on by our overdependence on boutique fuels. Most recently, in south-
eastern Wisconsin, a fire at a refinery resulted in consumers paying $2 a gal-
on for gasoline because we could not bring in gasoline from other regions
without violating the Clean Air Act.

The bill before us could have limited
the different blends of gasoline in use
around the country, so that if one area
had a shortage, fuel could be imported from another region. I
worked with members of the Wisconsin
delegation to include language to solve
this problem in the future, but that
was not retained in the conference
Committee negotiations. Wisconsinites
will continue to be held hostage to local
refineries during supply disrup-
tions.

I supported provisions in the Senate
energy bill that would have created a
renewable fuels portfolio standard or
RPS. The RPS was going to be an ag-
gressive target that would have created
a significant market for renewable en-
ergy technologies. While the bill does
contain tax provisions to encourage
the use of renewable energy, the RPS
was a new and exciting effort to wean
us of our addiction to fossil fuels. The
RPS was dropped in conference, even
though it had received several strong
votes in the Senate. Many States are
wrestling with what a national requirement would have set the renew-
able energy industry on a path to
mainstream success. Instead, we are
left with small changes at the margins
which will not significantly affect our
energy production.

High electricity prices over the last
few years have made it clear that con-
sumers need better protection from un-
scrupulous companies. Again the Sen-
ate bill contained provisions that
would protected consumers from the
kind of price gouging schemes created
by Enron. My colleagues worked hard
to make sure the Federal Energy Regu-
lationary Commission had the teeth and
the oversight capability to protect con-
sumers. Even with the Public
Utility Holding Company Act.

The conference turned their back on
the Senate provision and embraced House language that defends industry
at the expense of State and Federal
regulators.

The Congress has squandered another
opportunity to craft a far reaching and
progressive energy policy for this coun-
try. Instead we have chosen to pander
to special interests and create a par-
cularly unhealthy piece of legislative
language. The bill before us today is a
lament with three time the tax breaks the
President requested, and more than
$100 billion in spending. We can do bet-
ter than this. We should do better than
this, which is why I oppose the bill and
support the filibuster. Congress owes it
to the American people to come back
next year and put together a bill that
meets the needs of everyone, con-
sumers and industry alike, instead of
playing favorites and leaving the tax-
payers with the bill.

Mrs. MURRAY. Mr. President, I want
to take time to comment on the En-
ergy bill before us today.

It is disappointing that such a mas-
ive bill could do so little to promote
our energy independence, national se-
curity, economy, or environment. It
does nothing to protect our rate-payers
from the type of energy crisis we faced
in the Pacific Northwest and Cali-
ifornia. Those who claim otherwise are
simply masking the real mission of
this bill which is a taxpayer giveaway
to the big energy companies.

A 1,200-page bill has much to com-
ment on, but I will not take time to de-
tail every concern I have. I want to dis-
cuss the electricity title, the lack of a
true energy policy, and threats to our
environment.

First let me discuss the electricity
title of the bill. For those of us from
the Pacific Northwest this title was of
the utmost importance.

For over 2 years the Pacific North-
west has been struggling against the
Federal Energy Regulatory Commis-
sion’s, FERC, effort to deregulate the
transmission system through its pro-
motion of regional transmission or-
ganizations, RTOs, and standard market
design, SMD, rules.

Two simple points: First, FERC had
proposed a solution in search of a prob-
lem that doesn’t exist in the Pacific
Northwest. Second, the one-size-fits-all
approach being promoted by FERC
would neither work nor be cost-effec-
tive in our unique hydropower based
system.

With those concerns in mind I have
been working with many of my col-
leagues in the Pacific Northwest and
Southeast, who have similar regional
concerns, to keep FERC from moving
forward with these plans. I am pleased
that the bipartisan group has been suc-
cessful in delaying until 2007 FERC’s
ability to move forward with SMD.

While the bill delays SMD implemen-
ting the direct effects of the recently stop
FERC from ultimately pursuing this
power grab, and does nothing to stop
RTO development.

In fact, the bill is an outright en-
dorsement of the RTO plan, going so
far as to provide incentives to utilities
for joining such transmission organiza-
tions. FERC has not demonstrated
that such a system in the Pacific Northwest
will be an economic benefit to the re-
gion and, to date, the majority of
Washington State utilities remain op-
posed to the RTOs. Even with the SMD
delay provision, this bill is a threat to
the electricity system of the North-
west, and I cannot yield my voice to this
bill’s support of RTOs.

Also of great concern in the elec-
tricity title is the bill’s failure to deal
with market manipulation. The Pacific
Northwest and California are still feel-
ing the after effects of the 2000–2001
energy crisis that we now know was
caused, in large measure, by energy
companies manipulating prices.

Given the lessons we have learned
over the past 3 years, I hope that the
Congress will be more than just a
proposer of a solution in search of a prob-
lem that doesn’t exist in the Pacific
Northwest. Second, the one-size-fits-all
approach being promoted by FERC
would neither work nor be cost-effec-
tive in our unique hydropower based
system.

By remaining virtually silent on market
manipulation, this bill is giving
a nod to energy companies to once
again employ Fat Boy, Get Shorty, and
other infamous past and present
manipulation schemes.

This bill is an open invitation for
companies to once again seek to fatten
shareholders’ wallets at the expense of
ratepayers. This is more true now that
FERC has not demonstrated that
ratepayers. This is more true now that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
FERC has not demonstrated that
During the past 3 years of debate on energy I have acknowledged we should recognize the current importance of oil, gas, and coal in our energy production today. But to ensure America’s energy security for the future, it must strongly promote energy efficiency, conserve, clean, and renewable energy sources, and should diversify our energy sources. 

But rather than aggressively promoting renewable energy and conservation, the bill maintains the status quo. This bill directs billions of taxpayer dollars to traditional energy producers who already have healthy market shares and hardly need Government support. Of the roughly $23 billion in tax credits in this bill, only $4.9 billion, or 20 percent, would go towards renewable energy or conservation.

I support the production tax credits for wind, solar, geothermal, and biomass renewable energy in this bill, but unfortunately public power is left out of the equation.

Many Washington residents are served by public owned utilities and cooperatives and they should receive the same incentives to invest in renewable energy as this bill gives to the for-profit utilities.

Earlier drafts of the bill title included a tradable tax credit for public power investment in renewables. I know that Senate Finance committee members fought for this provision, but unfortunately the President and House objected to the provision.

While much of Washington and the Pacific Northwest served by public power utilities, it will be much harder to get these type of investments made.

We hear constantly that we need to decrease our reliance on oil from the Middle East and yet this bill does nothing substantive to increase automobile efficiency standards. The United States is the most technologically advanced country in the world. There is no reason we cannot build and produce more fuel-efficient cars.

Without addressing fuel efficiency standards, it is hard to praise this bill for promoting energy efficiency or national security.

In the end, this bill does nothing more than preserve the status quo of energy production in the United States. We are not more secure, we are not more independent, and we have not truly diversified our production sources. So much of this bill is promote the traditional energy sources of oil, coal, and gas at the expense of our national security and environment.

This bill does serious harm to our environment and our health by effectively rolling back the clock on decades-old environmental protections.

First, the bill includes a provision that would amend the Clean Air Act to allow more delays for adhering to the EPA’s smog regulations. This provision is not only illogical, it is dangerous. This bill would repeal the Clean Air Act to authorize energy development projects on the Outer Continental Shelf, OCS, including the transport and storage of oil and gas. At the same time, it would undermine the rights of States to manage the Coastal Zone Management Act, CZMA. States were given the right to have a say in Federal projects that impacted their coastal regions. This bill would severely compromise these rights.

Third, the bill has alarming environmental implications for drilling and construction projects. It would allow an expedited application process for drilling on Federal lands by requiring the Department of the Interior to automatically grant authority to the Department of the Interior to authorize energy development projects on the Outer Continental Shelf, OCS, including the transport and storage of oil and gas. At the same time, it would undermine the rights of States to manage the Coastal Zone Management Act, CZMA. States were given the right to have a say in Federal projects that impacted their coastal regions. This bill would severely compromise these rights.

Fourth, I am concerned about a measure to provide legal immunity to refineries who produce the gasoline additive MTBE. The toxic substance is known to have caused ground water contamination and this bill shifts costs for cleanup to taxpayers.

Lastly, this bill contains huge amounts of subsidies for the oil and coal industries. Nearly half of this bill’s incentives are given to the oil and coal industries, two of the most environmentally destructive fossil fuels that have contributed to global warming. This is not just irresponsible; it is wrong.

We must actively work to reduce our dependence on foreign oil, but subsidizing the industries and rolling back environmental protections is not a logical methodology.

In contrast, the bill provides less than one-quarter of its incentives to industries that produce renewable energy. The facts are clear. Renewables are simply not the top priority of this piece of legislation.

These are some of the many reasons I cannot support this piece of energy legislation. Not only does it put consumers at risk by repealing necessary protections, but it seriously puts at risk our own health and the health of our environment with its special interest giveaways to the oil, gas, and coal industries.

Finally, let me address the claims about job creation in this bill. For Washington State, a more aggressive promotion of renewable energy could have been a boost to local companies involved in this area of generation, but this bill did not provide that direction.

Proponents have argued that the bill encourages the construction of a natural gas pipeline from Alaska, which would create jobs in Washington State. Unfortunately, the bill does not provide the guarantees needed for what could have been an important project. Oil and gas drillers say they would need some protection against gas prices falling below a certain level. But, this bill provides no mechanism for risk mitigation, so according to its own builders, the pipeline will not be built.

The negative aspects of this bill are overwhelming. It fails to adequately address the real problems that we all face. It threatens the environmental progress we have made in the past and the progress we hope to make in the future. Without measures that substantially promote responsible energy use, increased conservation, energy independence, consumer protection, and environmental safeguards, this bill is simply unacceptable.

I cannot support legislation that puts us all in danger, and that is exactly what this bill does. The people of Washington State deserve better, and the people of America deserve better.

Mr. LEVIN. Mr. President, this bill is so flawed and so difficult to oppose a bill that has a number of provisions that I not only support, but worked to have included in the bill. However, the process and the product are deeply flawed and I cannot support it.

There are many objectionable provisions that were added to this bill that were not in either the House or Senate versions of this legislation; for instance the retroactive MTBE liability waiver, underground storage tank provisions that would require taxpayers, rather than polluters, to pay $2 billion to clean up leaking underground storage tanks containing gasoline and other toxic chemicals, even at sites where liable responsible parties are identifiable, and the numerous state-specific projects that will cost billions of dollars and were, again, not considered by the House or the Senate.

The Senate passed a comprehensive and balanced Energy bill in July. Then, after weeks of closed-door meetings with virtually no input from Democratic conferees, the Republicans put forward this “take it or leave it” Energy bill that is drastically different than the bill that the Senate passed. We had no opportunity to vote on this bill, or choose among its good and bad provisions. It is all or nothing.

There are simply too many provisions on the negative side of the ledger. The massive power failure of August 2003, on top of the massive price manipulation perpetrated by Enron and others, provided additional proof, proof that shouldn’t have been needed, that the United States’ deregulated energy markets are not functioning well. This bill doesn’t help that problem. It may make it worse.

The Conference report would repeal the Public Utility Holding Company
Act of 1934, PUHCA, longstanding consumer and investor protection legislation governing energy industry structure and consolidation, 1 year after enactment of this bill. Unfortunately, the bill fails to provide adequate protections to prevent industry market manipulation and consumer abuses. Governor Granholm of Michigan has said that replacing PUHCA with “weaker anti-fraud and market manipulation rules” could weaken the States’ ability to protect consumers. Further, while the enactment of this legislation’s mandatory reliability provisions would be an improvement over the current voluntary system of standards, the bill fails to ensure that regional transmission organizations will have the authority to enforce those standards in order to prevent, or respond effectively to, another blackout. Uncertainty in the power industry threatens our economy and security and erodes the nation’s investor confidence in U.S. energy markets. If necessary, we should adopt a stand-alone bill that sets mandatory reliability standards, requires utilities to join regional transmission organizations, establishes consistent penalties for the enforcement of standards nationwide than pass an Energy bill filled with so many harmful provisions.

In addition, two provisions in this conference report would significantly impede the ability of Federal and State agencies to investigate and prosecute fraud and price manipulation in energy markets. These provisions would make it easier to manipulate energy markets with impunity.

Section 1281 of the electricity title states: “Any request for information to a designated contract market, registered derivatives transaction execution facility, board of trade, exchange, or market account, agreements to enter into, transactions, contracts or transactions in commodities (including natural gas, electricity and other energy commodities) within the exclusive jurisdiction of the Federal Energy Regulatory Commission shall be directed to the Commodity Futures Trading Commission.” Section 332(c) of the oil and gas title contains similar language specifically applicable to investigations by the Federal Energy Regulatory Commission, FERC.

If adopted, this would curtail all State and Federal authority, other than CFTC, to investigate wrongdoing in CFTC-regulated markets. This would undermine FERC, Department of Justice, and State investigations of fraud and manipulation in these markets. It would turn the CFTC into an impediment for all other Federal and State investigations into matters within its jurisdiction that would be an unprecedented intrusion into the enforcement of State and Federal consumer protection laws. Had this approach been in effect in recent years, FERC would not have been able to investigate virtual manipulation of the energy markets, including the fraud and manipulation perpetrated by Enron through EnronOnline.

Section 1232 of the electricity title would impose a higher criminal standard, “knowingly and willfully,” for filing false information and for improper round trip trading than exists under current law. The new round trip trading provision is inconsistent with current law and the Cantwell amendment, which prohibited market manipulation in electricity markets, and which recently passed the Senate.

For example, section 4c of the Commodity Exchange Act states it is “unlawful for any person to enter into a transaction . . . involving the purchase or sale of any commodity for future delivery” if the transaction “is, of the character of, or is commonly known to the trade as a ‘wash sale’ or a ‘fictitious sale.’” There is no requirement that the violation be “willful.” Manipulation is difficult to prove even under current law. By raising the burden of proof, this provision will make it easier to prove illegal round trip trading or wash sales. Rather than weakening the laws preventing fraud and manipulation in energy markets, the Congress should be strengthening these prohibitions.

There are provisions that would affect FERC’s ability to ensure markets are transparent and fair.

The “Enron loophole” was attached during the conference on an omnibus appropriation bill in 2000, and was a factor in the manipulation and manipulation of the energy markets in 2000 and 2001. The provisions in this bill, attached under hurried circumstances would widen the loophole and increase the chances of more manipulation and dysfunctional markets. This is the wrong response to the current crisis of confidence and integrity in our energy markets.

I am also disappointed that the conference report on this bill directs the Department of Energy, DOE, “as expeditiously as practicable, acquire petroleum in amounts sufficient to fill the Strategic Petroleum Reserve to the [1 billion] barrel capacity,” but does not include any direction to DOE to fill the SPR in a manner that minimizes the cost to the taxpayer or maximizes the overall supply of oil in the United States. That second direction is critical—otherwise the filling of the SPR could lead to continuing high gas prices.

The Levin-Collins amendment, which was adopted unanimously by the Senate last month, directed DOE to develop procedures to fill the SPR in a manner that minimizes the cost to the taxpayer and maximizes the overall supply of oil in the United States. The Levin-Collins amendment expressed the sense of the Senate that the DOE’s current procedures for filling the SPR are too costly for the taxpayers and have not improved our overall energy security.

DOE’s internal documents state that filling the SPR without regard to the price and supply of oil in the global markets exacerbates price problems in those markets. By increasing demand for oil at a time when oil is in scarce supply, the SPR program pushes the price of oil up even further. Moreover, when near-term prices are higher than future prices, oil companies will meet the additional demand for crude oil by removing oil from their own inventories rather than purchasing high-priced oil on the spot market. Thus, under these price conditions, which are so closely tied to inventory levels, filling the SPR under these market conditions both depletes private sector inventories and pushes up prices for America’s consumers.

Furthermore, according to the Department of Energy’s own analyses, and as expressed in a concurrence as the DOE did prior to early 2002—can save taxpayers several hundreds of millions of dollars over the span of a few years. Acquiring more oil when prices are low will increase revenues to the Treasury from sales of high-priced oil that is not needed to fill the SPR. Second, allowing oil companies to defer deliveries to the SPR when prices are high in return for the delivery of additional barrels of oil at a later date—as DOE did prior to early 2002—enables the DOE to increase the amount of oil in the SPR without any additional costs.

In summary, the unqualified direction in the bill to DOE to fill the Strategic Petroleum Reserve to 1 billion barrels is likely to increase the cost of crude oil and crude oil products, such as gasoline, home heating oil, and diesel and jet fuel, to American consumers and does so in a way that is not as beneficial to the taxpayer, with uncertain benefits to our national security.

Also, while I support the provision in this legislation that would increase the use of ethanol to 5 billion gallons by 2012 and 13 billion gallons by 2022, it needs to be reasonable in a way that ensures the continued viability of the Highway Trust Fund.

Twice the Senate passed legislation that included a Volumetric Ethanol Excise Tax Credit, VTEEC, that would address the shortfall in revenue to the Highway Trust Fund that was caused by the ethanol tax exemption. In addition to taxing ethanol, the VTEEC, as passed by the Senate, would retain the credit for ethanol production by paying for it from the general treasury, create a biodiesel credit and ensure that all taxes charged on ethanol go to the highway trust fund. DOE’s arrangement worked out by House and Senate Republicans gives ethanol blenders the new option to receive a 5.2 cents per gallon excise tax credit after paying for the federal gas tax or they could continue receiving the current ethanol exemption of 5.2 cents. Since most blenders likely would continue to choose to receive the exemption up front rather than wait for a tax
credit, the highway trust fund would still lose billions of dollars per year. Efforts by Senator BAUCUS to address this problem were approved by the Senate conference, but was refused by the House. While I support increased ethanol production, it is imperative that increased production does not diminish the Highway Trust Fund.

Additionally, I am troubled that this legislation exempts producers of MTBE from liability. MTBE, an oxygenate that could be replaced by ethanol, is a potentially harmful product and its producers should not be exempt from liability. In Michigan, it has been estimated that MTBE has contaminated ground water around 700 leaking underground storage tank sites. Further, as many as 22 water supply wells have been deemed unusable due to MTBE contamination. Because of this MTBE liability waiver, the State of Michigan may have to pay over $200 million to clean up those sites. Governor Granholm has strongly protested that we need to hold manufacturers accountable for the damage that MTBE does to public health and the environment, not guard them from liability which then allows them to pass the costs on to the States.

As I stated earlier, this bill has a number of provisions that I support and that I worked to have included in it. These include tax credits for advanced technology vehicles and joint research and development between the Government and the private sector to promote the expanded use of advanced vehicle technologies. But in the end, the good provisions must be weighed against the large number of bad provisions, and there are too many objectionable provisions for me to support this bill.

The Senate has worked to create a national energy policy for years. In just a few weeks, without bipartisan negotiation and in the absence of legislation, a partisan product was created. We should work to complete a long-term, comprehensive energy plan that provides consumers with affordable and reliable energy, increases domestic energy supplies in a responsible manner, invests in energy efficiency and renewable energy sources and protects the environment and public health.

Mr. LIEBERMAN. Mr. President, I rise in the strong opposition to the bill before us, the Energy Policy Act of 2003. The bill before us is a pork-laden, budget-busting, fossil-fuel promoting vestige of the past, developed largely in secret by a handful of GOP Members. This legislation is a mere shadow of which it was and could be.

This could have been a proud moment for this Congress and for the Nation. Rather than caving to special interests and wallowing in pork barrel politics, we could have risen to the challenge and met our obligation to help promote the good provisions for me to support this bill.

The Senate has worked to create a national energy policy for years. In just a few weeks, without bipartisan negotiation and in the absence of legislation, a partisan product was created. We should work to complete a long-term, comprehensive energy plan that provides consumers with affordable and reliable energy, increases domestic energy supplies in a responsible manner, invests in energy efficiency and renewable energy sources and protects the environment and public health.

Mr. LIEBERMAN. Mr. President, I rise in the strong opposition to the bill before us, the Energy Policy Act of 2003. The bill before us is a pork-laden, budget-busting, fossil-fuel promoting vestige of the past, developed largely in secret by a handful of GOP Members. This legislation is a mere shadow of which it was and could be.

This could have been a proud moment for this Congress and for the Nation. Rather than caving to special interests and wallowing in pork barrel politics, we could have risen to the challenge and met our obligation to help promote the good provisions for me to support this bill.
Fourth, MTBE liability protection. In a provision added in conference to benefit companies primarily based in Louisiana and Texas, the bill provides retroactive and prospective liability protection for producers of methyl tertiary-butyl ether (MTBE), curbing their fears that they would be held liable for the costs of cleaning up MTBE spills. This provision is included in the bill to make our air much dirtier.

Fifth, environmental protection rollbacks and giveaways. The icing on the cake for this bad bill is the significant environmental protections it strips away for the benefit of energy producers. The bill also contains new provisions to make our air much dirtier. The conference bill would exempt metropolitan areas from meeting the Clean Air Act's ozone-smog standard. This issue was never considered by the Senate or the House and was inserted into the conference report during 'conference committee' meetings. A new report from the Clean Air Council reveals that the ill-conceived Energy bill would have severe public health consequences around the country, especially for children. Implementing the Clean Air Act could lead to nearly 5000 hospitalizations due to respiratory illness and more than 380,000 asthma attacks and 570,000 missed school days each year. The bill exempts all construction oil and gas drilling sites from coverage under the Clean Water Act and removes hydraulic fracturing, an underground oil and gas recovery method, from coverage under the Safe Drinking Water Act. The conference bill expedites energy exploration and development at the expense of current National Environmental Policy Act, NEPA, requirements. Environmental review is waived for all types of energy development projects and facilities on Indian land.

I want to be fair. The conference bill does contain provisions that make limited progress—baby steps only—toward achieving energy goals. And the bill recognizes the political reality that the Senate has spoken forcefully to the issue of the conference report before us.

Maryland Senator JIMMIE DOMENICI and Finance Committee Chairman GRASSLEY for the extraordinary time and effort they have devoted to developing a national energy policy for a 21st century America. Theirs was an arduous task in addressing not only political differences with the bill but also regional ones as well. So I thank them for their work.

Congress has been debating and voting on a number of energy issues over the past two Congresses, one when under Democratic control and one under Republican leadership. There have been a myriad of issues to consider as we have attempted to shape appropriate policy, and to help increase the public's awareness of the benefits to our health and national security in shifting from foreign fossil fuel imports toward renewable, efficient, and alternative energy sources and technologies. Yes, it has been a long, hard road but this conference report simply does not put us on the right road to accomplish these goals for the good of the Nation. We have yet to find that new direction, but we must keep seeking it.

As Theodore Roosevelt once said, 'Conservation is a great moral issue, for it involves the patriotic duty of ensuring the safety and continuance of the nation.' The conference bill has the opportunity to raise the bar for the Nation's future domestic energy systems through new energy policies, through the creation of tax incentives for available and developing technologies, and most of all for incentivizing the entrepreneurial spirit of the American people. But, this goal, in my opinion, has not been reached in the Energy conference report before us.

Since we started to develop new strategies for the Nation's energy policy for the 21st century, we have had to undergo a fundamental reassessment of our energy infrastructure in the aftermath of the horrific events of 9/11 and the ongoing turmoil in the Middle East. We realize now more than ever that we must reduce our vulnerabilities to terrorism with more secure, localized, and reliably distributed energy delivery systems rather than relying solely on our current centralized infrastructure of pipelines, refineries, powerplants, patchwork of electricity grids, and oil tankers berthed in our harbors. The United States simply cannot afford to continue to spend at least $57 billion a year buying oil from the Middle East and continue its upward trend of fossil fuel usage.

The entire world—particularly the developing and fast-growing nations of China, India, and Brazil—desperately needs access to clean, low-cost, energy-efficient, and renewable resources. The key is to make the best alternate energy systems that are competitive with today's nonrenewable sources of energy
so that they can be developed and used both at home and sold abroad.

Since 2000, I have been proud to have been a member of the Finance Committee where I worked to develop responsible tax incentives to increase the efficiency of the electric sector to develop, the vehicles we drive, the appliances we use, the homes in which we live, and, in turn, enhance the competitiveness of our domestic manufacturers. Our task is to incentivize, through the Tax Code, our U.S. manufacturers to develop and employ the most promising and cost-effective technologies to the U.S. and global marketplace with all due speed.

Unfortunately, the conference report increases oil and gas tax credits to $11.9 billion while conservation and energy efficiency incentives were decreased to $1.5 billion. An equitable balance has not been achieved nor is it a step forward.

We need to expand the mix of the country’s energy sources with the realization that power from nuclear and fossil fuels will continue to be a large part of the energy basket in the next decades—but, at the same time, we must encourage safer, cleaner and decentralized energy as well. The conference report before us simply does not progress far enough in this direction, instead maintaining more of a “business as usual” approach to the Nation’s energy future.

Once of my greatest disappointments is the absence of provisions from the Feinstein-Snowe SUV loophole legislation that would have phased-in changes in CAFE standards requirements in four, attainable stages that would have brought the standards for SUVs in line with passenger cars within the next 8 years. Closing this loophole alone would save our nation approximately 1 million barrels of oil, or fully 10 percent of the oil our vehicles consume on a daily basis.

Right now, all our vehicles combined consume 40 percent of our oil, while coughing up 20 percent of U.S. carbon dioxide emissions—the major greenhouse gas linked to global climate change. To put this in perspective, the amount of carbon dioxide emissions just from U.S. vehicles alone is the equivalent of the fourth highest carbon dioxide emitting country in the world. Given these stunning numbers, I cannot for a minute continue to allow SUVs to spew three times more pollution into the air than our passenger cars.

Like Senator Feinstein and I, other nations have realized the value of these changes. Even China—a developing country—has great concerns about its increased reliance on foreign oil, so much so that Chinese officials say they have to save energy—and how are they prepared to accomplish this? By implementing more stringent CAFE standards—similar to those in the United States overall fuel economy has actually fallen to its lowest level since 1980.

According to a November 18 New York Times article, vehicles made by Western automakers that do not meet the standards the Chinese Government has drafted may have to be modified to get better gas mileage before the first phase of the new rules becomes effective in July of 2005. I ask unanimous consent to print the November 18 article in the RECORD.

There being no objection, the material was ordered to be printed in the RECORD, as follows:

CHINA SET TO ACT ON FUEL ECONOMY: TOUGHER STANDARDS THAN IN U.S.

(By Keith Bradsher)

GUANGZHOU, CHINA, NOV. 17—The Chinese government is preparing to impose minimum fuel economy standards on new cars for the first time, and the rules will be significantly more stringent than those in the United States, according to Chinese experts involved in drafting them.

The new standards are intended both to save energy and to force automakers to introduce the latest hybrid engines and other technology in China, in hopes of easing the nation’s swiftly rising dependence on oil imports from volatile countries in the Middle East.

They are the latest and most ambitious in a series of steps to regulate China’s rapidly growing auto industry, after moves earlier this year to require that air bags be provided for both front- and rear-seat passengers in most new vehicles and that new family vehicles sold in major cities meet air pollution standards nearly as strict as those in Western Europe and the United States.

Some popular vehicles now built in China by Western automakers, including the Chevrolet Blazer, do not measure up to the standards Congress is close to completing work on. The Chinese rules do not cover pickups or commercial trucks. According to General Motors market research, there is little demand for pickup trucks in China except from businesses, because the affluent urban consumer who can afford a new vehicle regards pickup trucks as unsophisticated and too reminiscent of the horse-drawn carts still used in some rural areas.

Typically, heavy vehicles are much harder on fuel than light ones, but the new Chinese standards permit them to do so and get only slightly worse gas mileage. As a result, they provide an incentive for manufacturers to offer smaller, lighter vehicles, which will be easier to design.

The new standards would require all small cars sold in China to achieve slightly better gas mileage than the average new small car sold in the United States now gets, according to calculations by An Feng, a consultant who advised the government on the rules. But under the new rules, Chinese automakers will need to improve their minimum gas mileage for minivans even more. As a result, the new rules may help push some Chinese automakers toward other countries, because the affluent urban consumer who can afford a new vehicle regards pickup trucks as unsophisticated and too reminiscent of the horse-drawn carts still used in some rural areas.

with an average fuel economy of 27.5 miles a gallon under a combination of city and highway driving with no traffic, window-sticker values for gas mileage, which include the effects of acceleration, braking, and idling, tend to be 15 percent lower. Light trucks, including vans, S.U.V.’s and pickups, are allowed an average of 20.7 miles a gallon without traffic.

But the Bush administration has raised the comparable American standard to 22.2 miles a gallon for the 2007 model year and is now considering whether to raise it further for 2008. The administration is also considering adopting different standards for different weight classes of light trucks.

Overall, fuel economy in the United States has been eroding since the late 1980’s as automakers shifted production from cars to light trucks. It fell in the 2002 model year to the lowest level since 1980. Automakers in Europe have accepted European Union demands to increase fuel economy under different rules that could possibly be just as stringent as China’s minimums.

The Chinese standards would require the greatest increases for full-size S.U.V.’s like the Ford Expedition, which would have to go as much as 29 percent farther on a gallon of gas in 2008 than they do now in the United States, Mr. An calculated. Sport utility sales in China have doubled so far this year, but are still a much smaller part of the overall market than they are in the United States.

Because the American standards are flatter averages while the Chinese standards are minimums for each vehicle, the effect of the Chinese standards could be considerably more stringent. A manufacturer can sell vehicles in the United States that are far below average in fuel efficiency if it has others in its product line that average it by being above average. But under the Chinese rules, the fuel-inefficient models—especially new ones introduced after the standards take effect—would have to also meet the new mileage.

Another concern is that the government made the new rules in response to the threat of Chinese regulatory actions.

Japan is also phasing in new fuel efficiency standards based on vehicle weight that allow heavier vehicles only slightly worse mileage than lighter ones. American automakers have complained that the Japanese rules discriminate against them because Japanese automakers tend to produce slightly lighter cars anyway.

China has more than 100 automakers, as compared with the few rules the U.S. currently have under the Chinese mileage standards is Toyota, which on Nov. 6 began selling a locally produced version of its full-sized Land Cruiser in China. A Toyota spokesman on Monday that Toyota had not yet heard about the new Chinese fuel economy regulations, which has been prepared with a life cycle perspective typical of many Chinese regulatory actions.

The government has been encouraging the industry to consolidate, and the new rules may hasten that process by forcing investment in engine designs that small companies may not be able to afford on their own.

Ms. SNOWE. Mr. President, just consider for a moment how much the world has changed technologically over the past decade and the advent of the home computer and the information age. Computers are now running our automobiles, and global positioning system devices are guiding drivers to their destinations. Are we to believe that technology couldn’t have also helped us to turn less fuel in getting there? Are we going to say that, while even a developing country like China is transforming, America doesn’t have the wherewithal to make S.U.V.s that get better fuel economy? We should keep in mind that China is expected to pass the United States in the next 10 years as the largest emitter of manmade carbon dioxide, the major greenhouse gas that the vast majority of international scientists believe is causing global climate change. And, it is interesting to note that there is not one mention of climate change in the entire conference report. Not one reference in a report of over 1,000 pages that is supposed to shape the Nation’s energy policy for the 21st century.

Last year’s Energy bill—which I remind my colleagues is the bill the Senate actually passed this year—had at least three different titles addressing climate change, including research on alternative fuels and a $225 million program in the administration’s National Energy Policy of May, 2001, stated, “Energy-related activities are the primary sources of U.S. man-made greenhouse gas emissions representing about 85 percent of the U.S. man-made total carbon-equivalent emissions in 1998.”

Other grave concerns I have involve provisions in the report that will threaten coastal and marine environments and lead to further degradation of our oceans. As Chair of the Subcommittee on Fisheries, Oceans, and the Coast Guard, I am troubled by the ramifications of these provisions, as I strongly believe that any changes to U.S. marine policy should only be developed with contributions and oversight of the Subcommittee.

For example, under section 321 of title III, the bill grants sole authority for all energy-related projects in the Outer Continental Shelf to the Secretary of the Interior. Currently, protecting these ecosystems is the responsibility of the Department of Commerce. This section does not suggest that the Department of the Interior should even consult with Commerce.

Two other sections in this bill would limit the ability of the Secretary of Commerce and commerce, and the Outer Continental Shelf, to the Secretary of the Interior. Currently, protecting these ecosystems is the responsibility of the Secretary of Commerce. This section does not suggest that the Department of the Interior should even consult with Commerce.

Further, section 325 would shorten the timeframes for submitting information and appealing the permitting decisions for offshore activities that are inconsistent with States’ coastal management plans—regardless of the quality or quantity of information received.

Another section, section 330, would grant all coastal States the rights of offshore energy action to the Federal Energy Regulatory Commission. I believe that the Secretary of Commerce should have the discretion to develop a record that is relevant to issues under appeal.

These provisions are inconsistent with the administration’s proposed rule amending the appeals processes, and they conflict with the goals and purposes of the Coastal Zone Management Act reauthorization bill, S. 411, I introduced last January. Moreover, the U.S. Commission on Ocean Policy, established and appointed by President Bush pursuant to the Oceans Act of
2003, is poised to present its recommendations to Congress on offshore energy and other ocean-related issues.

All of these provisions have serious consequences for marine environmental health, and they should not be hastily adopted without the thorough input of the Commerce Committee, the administration, and the U.S. Commission on Ocean Policy.

Moving from our oceans to our air, there are other disturbing provisions in the conference report that have been raised by many of my colleagues. For instance, the report contains a provision delaying clean air protections for millions of Americans, leading to thousands of additional asthma attacks—and that is of particular concern to me as my State of Maine leads the Nation in per capita cases of asthma.

Also, I am disappointed that the conference report contains no renewable portfolio standard, or RPS, to raise the amount of renewable energy as a source of energy nationwide. Increasing the percentage of electricity produced from wind, solar, geothermal, incremental hydropower, and clean bio-mass that produces electricity from burning forest waste, the conference report does not ban MTBE that is polluting our ground water for another decade rather than the 4 years in the Senate bill, while at the same time virtually dismissing pending lawsuits states already have filed against MTBE producers for cleanup. State officials in Maine do not approve of extending the ban on MTBE or the fact that the heavy financial burden of cleanup will shift to the communities and water users because MTBE producers receive a safe harbor from lawsuits in the report.

For hydropower, the conference report provisions give the last say for hydropower permits to industry and does not give equal weight to the agencies’ stakeholders processes that have served so well in Maine for reaching consensus on hydropower decisions, especially for dam removals.

On electricity reliability, the report holds up FERC’s ability to go forward with its standard market design for regional transmission organizations—or RTOs except on a voluntary basis, until 2007. A voluntary only program, however, does not spur the capital needed right now for increased electric transmission and to 50+ GW of installation, in New England, for instance. I hope my colleagues are aware that the New England RTO kept the great majority of New England’s electricity grid working and the lights on during the blackout of August of 2003. Actually, the only component of the electricity tit that effectively addresses the basic causes of the 2003 blackout is the establishment of electric reliability organizations that would enforce reliability standards through improved communication standards and would be overseen by FERC.

Regarding consumer protections, the conference report repeals PUHCA, the Public Utility Holding Company Act, that currently protects consumers from higher electricity prices. However, the conference report contains little language that ensures that consumers are shielded from higher bills resulting from, for instance, large electric company mergers and convergence mergers. Public Power, co-ops and municipalities, who represent 25 percent of the industry, are especially vulnerable to the lack of adequate consumer protections in the report.

Also, the conferees stripped the tradable tax credits for Public Power that I and others had included in the Senate Finance Committee amendment. These tradable tax credits would have allowed Public Power to invest in renewable energy and assist them in decreasing their CO2 emissions by moving away from burning as much coal as they currently do.

On fiscal policy, I do not believe the conference report shows fiscal restraint and responsibility. The fiscal year 2004 budget resolution calls for approximately $15.5 billion to be spent on tax incentives, and the Senate Finance Committee stayed within this budget blueprint. The conference report contains a tax incentives plus another $6.4 billion in spending and with no offsets.

One of my concerns is that important tax incentives that appeared in the Senate and House Energy bills over the past 2 years have not been included in the conference. Where they have been included, they are so pared back that I question whether the various industries will take advantage of the smaller energy efficiency tax incentives provided, particularly for the construction, lighting, and heating, ventilation and air-conditioning, or HVAC, for commercial buildings.

The bill omits a renewable energy portfolio standard, RPS, that would have required utilities to produce 10 percent of their electricity from renewable sources. That is a serious omission. A majority of the Senate conferees voted on the right course for the future and we should go forward with the hope that Congress can continue working toward a more meaningful, secure, and balanced energy-efficient future for the Nation.

Mr. DORGAN. Mr. President, I rise to support the conference report. I believe our country will be better off with this bill than without it. On balance, it will advance our interests.

This bill takes important, major steps toward developing renewable and limitless sources of energy such as ethanol, wind, and biodiesel. It puts us on the road to the development of a new hydrogen fuel cell economy, which is essential if we are to lessen our dependence on foreign oil. It contains important conservation measures by improving efficient standards on appliances and other devices we use in our daily lives. If we are serious about securing our energy future, I believe we must implement these measures without delay.

Additionally, this bill enhances our ability to develop more traditional sources of energy, while protecting our environment, contains strong provisions to promote clean coal technology so that we can more effectively use our coal resources without degrading our environment. The bill also funds a pipeline to access over 30 million cubic feet of natural gas from Alaska and bring it to the lower 48 States. And it provides additional incentives for the discovery and recovery of oil and natural gas.

There is much in this bill that is positive, and I intend to vote for it. Having said that, I know this bill is far from perfect. But in some important matters, it is a step in the right direction.

A majority of the Senate conferees voted on the right course for the future and we should go forward with the hope that Congress can continue working toward a more meaningful, secure, and balanced energy-efficient future for the Nation.
Unfortunately, this bill also provides liability protection for the producers of the fuel additive, MTBE. This is a major mistake. Insulating the big oil companies, while making the mom and pop gas stations of America liable for the costs of cleaning up these contaminated sites is simply wrong and bad policy.

I also want to address concerns that the bill waives a number of other important environmental provisions. For years the administration has complained that the process of siting and permitting new energy projects is cumbersome and in the name of efficiency needs to be modified. This measure does that. But let me caution the administration for a moment. While Congress has provided discretion to the appropriate agencies in an effort to streamline the process, these agencies will be held accountable if they violate the spirit and trust we have given them. I expect these agencies to make informed decisions based on public input, sound science and common sense.

Additionally, as a member and former chairman of the Commerce Committee’s Consumer Affairs Subcommittee, let me address the issue of consumer protection. This bill repeals the Public Utility Holding Company Act and does not, in my opinion, go far enough to protect consumers from price gouging. Congress will be watching very closely to ensure that the agencies responsible for preventing market consolidation and market manipulation are doing their job. I believe we must keep pushing to get better protections for consumers. The experience on the west coast in recent years is a painful reminder that corporate power, if left unchecked, can cause serious injury to our consumers.

These deficiencies in the Energy bill could have been avoided had the majority party included Democratic conferees in a meaningful dialogue. Instead, Democrats were frozen out of the Energy conference. It was a flawed and arrogant process that prevented the American people from getting the best of what both political parties had to offer in the development of a national energy policy.

However, does the lack of involvement lessen the need for us to take steps to reduce our dependence on foreign oil and gas? Does it detract from our need to promote energy efficiency and energy conservation? Does it lessen our need to promote the use of renewable energy and renewable fuels and vehicles? I believe the answer to all of these questions is no.

I will vote for the conference report, because on balance, this bill is a net plus for America. But my vote is in no way an endorsement of the manner in which the majority conducted this conference. In the future, before conferees are appointed, we will insist on a commitment that both political parties be represented in the deliberations of the conference.

These concerns aside, we must remember that energy is vital to our economy and our way of life. We count on a reliable energy supply for our everyday needs—heat, light, electricity, and all of the things that keep our society productive. Our economy would collapse if we lost access to that supply, and were left without alternatives.

If, God forbid, terrorists would shut off the supply of oil to our country tomorrow, our economy would be flat on its back and a significant portion of the oil we use, much of it from troubled parts of the world. That holds our economy hostage to this growing dependence on imported oil, in particular to the Middle East.

We need a new energy future that contains strong provisions dealing with conservation, aggressive approaches to renewable and limitless sources of energy, and embraces a new hydrogen fuel cell future which can allow us to break our dependence on foreign oil.

If a meaningful energy policy is analogous to a novel, then this bill is just a first chapter. It is not as comprehensive, as wise, or as bold as the American people have a right to expect. Let me state this clearly. This bill is not a broad, end-all, comprehensive Energy bill, no matter who tells you it is. I am prepared to continue to modify, amend, and reform this measure as many times as and as long as it takes in order to ensure it does not prove to be a barrier to create a fair and balanced national energy policy, one that works to advance our country’s interest.

In closing, we are left with two choices: one, do nothing and pray we don’t have further blackouts, further price spikes, or God forbid, a terrorist strike on our supply of foreign oil; or two, enact the proposed energy legislation and use it as the first brick in the foundation of crafting a comprehensive energy policy that will reduce our dependence on foreign energy and strengthen our energy diversity and security.

Given these two choices, I choose action over inaction and urge my colleagues to do the same.

The PRESIDING OFFICER. The Senator from Kansas is recognized.

Mr. ROBERTS. Mr. President, it is my understanding that the pending business before the Senate is the Intelligence conference report; is that correct?

The PRESIDING OFFICER. The Senator is correct.

Mr. ROBERTS. Mr. President, I rise today to urge Senate passage of the conference report for the Fiscal Year 2004 Intelligence Authorization Act.

On November 9, 2003, the conference report was approved by the House of Representatives. In order to quickly provide the Intelligence Community the authorities it requires in order to pay, house, and equip its personnel for our most important and critical national security work, this legislation should be sent to the President without delay. The horrible terrorist attacks in Tur-
more costly than the budgeted funding. This underestimation of future costs has resulted in significant re-shuffling of NFIP funds to meet emerging shortfalls.

In an attempt to correct this problem, the conference report contains a provision which would mandate a fundamentally more sound approach to cost estimates for major systems. The business-as-usual approach must end.

There is another area I wish to mention that concerns concerns concerning the analytical capabilities of the intelligence community. All recent after-action reports or studies of intelligence failures point to the inability of analysts to process ever-growing quantities of information. In an effort to correct this problem, the committees agreed to move funds to programs at the Defense Intelligence Agency, the National Security Agency, and the CIA to improve the community’s analytical capabilities.

My key objectives in formulating the conference report were to ensure our Nation’s continuing effort to prosecute the war on terrorism and to ensure that the “longer view” about intelligence community requirements is taken into account. I believe that this conference report meets both objectives.

We met those objectives because we had bipartisan cooperation when and where it counted. I wish to thank the distinguished vice chairman, Senator ROCKEFELLER, as well as the distinguished House chairman, Representative Goss, and his ranking member, Representative HARMAN, for their assistance in making the conference report possible. The staff of both intelligence Committees must also be commended for their diligent work on this important legislation.

There is no opposition on our side of the aisle. We have worked very hard with the House to come up with a good compromise. This bill is vitally needed on behalf of national security. A similar bill passed the Senate several weeks ago by unanimous consent.

I yield to my distinguished colleague, the vice chairman, Senator ROCKEFELLER.

The PRESIDING OFFICER. The Senator from West Virginia is recognized.

Mr. ROCKEFELLER. Mr. President, I agree with the chairman of the committee. I yield the floor to my distinguished friend. There is no objection on this side. It has been cleared. There is no objection on our side. I presume the bill will be voted through.

Mr. President, I am pleased to join the distinguished chairman of the Select Committee on Intelligence in recommending passage of the conference report on H.R. 2417, the Intelligence Authorization Act for Fiscal Year 2004.

The bill authorizes appropriations for the Central Intelligence Agency, the Defense Intelligence Agency, the National Security Agency, and the intelligence components of the F.B.I. and other U.S. government agencies. It also contains a number of important provisions intended to lay the foundation for process and organizational changes in the intelligence community.

The classified nature of U.S. intelligence activities prevents us from discussing the details of our budgetary recommendations. As I described to the Senate when our bill was considered in July, 10 years ago I joined a majority of Senate colleagues in voting to express the sense of Congress that the aggregate amount requested, authorized, and spent for intelligence should be disclosed to the public in an appropriate manner. The House opposed the provision. I continue to believe that we should find a means, consistent with national security, of sharing with the American taxpayer information about the total amount, although not the details, of our intelligence spending. In holding the intelligence community accountable for performance, and the Congress and the President accountable for the resources they provide to the Intelligence Community, citizens should know the Nation’s overall investment in intelligence.

The bill includes a number of provisions intended to promote innovations in information sharing, human intelligence, and counterintelligence, among other things. Many of these initiatives represent initial steps rather than solutions, but they are necessary to raise the level of awareness in Congress and the executive branch regarding a variety of urgent and complex challenges and to lay the foundation for reforms the committee will be considering next year.

Section 351 of the bill requires a report on the threat posed by espionage in an era when secrets are stored on powerful, classified U.S. computer networks rather than on paper. A single spy today can remove more information with a digital device than spies of yesteryear could remove with a truck. We have already suffered losses, for example, in the Ames, Regan, and Hanssen cases, where sloppy computer security permitted traitors to exploit large quantities of highly classified information. Unfortunately, these cases provide a warning that appears to have gone largely unheeded. We still do not have a cohesive set of policies and procedures to protect our classified network infrastructure, which is what spies sometimes even very disturbing information which raises serious espionage issues, the government rarely revokes the clearances we rely on so heavily and which cost so much.

In the information age, we cannot wait 5 to 10 years to identify employee problems that may be related to espionage. Too much damage can be done too quickly. We need fresh thinking and recommendations that will provide more effective security for the large sums of money the taxpayer is investing.

Section 354 of our bill calls for a review of classified information sharing policies within the Federal Government. This is an issue closely related to the foregoing provisions regarding adequate security policies. ATM machines, for example, are a wonderfully convenient and efficient device for providing access to banking resources— but they could not exist without magnetic cards, personal identification...
numbers, cameras and locks. Similarly, improved security is not a barrier to more flexible information sharing. It is a fundamental ingredient. The Joint Inquiry report on the 9/11 attacks highlighted the importance of information sharing as a critical shortcoming that prevented the interdiction of several hijackers. To help accelerate reform, the Joint Inquiry requested an administration report by this past June 30 on progress to reduce barriers among intelligence and law enforcement agencies engaged in counterterrorism. Unfortunately, no report has been submitted.

We have the technology for improved information sharing, and significant progress is being made. A Terrorist Threat Integration Center has been established, and new guidelines regarding sharing of grand jury information have been promulgated. These are very important steps forward. But to truly break down the barriers to information sharing, relying on workarounds, we need revised policies on sharing classified information which recognize and exploit the opportunities provided by modern information technology. This is especially important as we look to the gap between the Intelligence Community and organizations charged with Homeland Security.

Section 355 of the bill identifies a problem that even the Defense Department does not know where most of the hardware and software it uses originates. Moreover, the Government does not have the right to examine source code unless voluntarily supplied. Moreover, at the present time, there are limited capabilities for analyzing source code that is made available. This situation requires serious attention by senior policymakers, including Congress, and the report required by section 354 should help to prompt a long overdue discussion of these issues.

In concluding my remarks, I would like to look beyond our current bill to the issues the Intelligence Committee must contend with next year. Other committees share responsibility for reviewing the funding and systems needed by the intelligence community, but our committee is uniquely positioned to evaluate the intelligence community’s performance—both its successes and failures—and to identify the changes required to meet the challenges of the future.

In my view, money alone is not sufficient to enable the intelligence community to reach its full potential. The current structure of the intelligence community is fundamentally unchanged from its establishment in 1947. Serious change is long overdue. I strongly believe that new structures and authorities, coupled with aggressive business process re-engineering and ‘year of execution budget authority’ for the DCI over NFIP programs, would significantly strengthen the DCI’s ability to manage the intelligence community and respond to new threats and opportunities.

A more aggressive and far-reaching plan would have to address the fundamental changes that have occurred since the current structure was established by the National Security Act of 1947. Specifically, it would recognize that the once useful distinction between home and abroad has become not only irrelevant, but dysfunctional. This is not to suggest any need to reduce the protections afforded U.S. personnel under the Constitution, merely to require the DCI to act in an manner that is not impeded by outmoded geographic distinctions. In that regard, we should find ways to more effectively coordinate foreign and domestic intelligence.

Achievement of any substantial reorganization will require meticulous research by the congressional oversight committees, a substantial hearing record, and sustained interest by the administration. At the end of the day,
incremental steps will be better than none, and a more aggressive reorganization require a consensus not only on the Intelligence Authorization Committees, but with the Armed Services Committees as well. As challenging as these issues are, we simply cannot fulfill our duty to the American people unless we confront these crucial issues when Congress returns next year.

In conclusion, the important steps we have taken with this measure, to include the fund of the Administration's requests for intelligence activities, are the result of lengthy deliberations on matters as complex as they are vital. It is gratifying to see the work that has been done in both Chambers come together today in a bill we can send to the President. It is a useful first step, but only a first step, towards the development of an intelligence community better able to adapt to the rapidly evolving threats confronting our great nation.

Finally, I would like to thank the chairman and the Committee staff for their arduous work on this bill. I look forward to making great strides together next year.

I urge support for this measure.

DEPARTMENT OF THE TREASURY,

HON. JOHN W. SNOW,
Secretary of the Treasury, Department of the Treasury, Washington, DC.

DEAR SECRETARY SNOW: A proposed amendment to section 105 of the Intelligence Authorization Act, H.R. 2417, would create a new Office of Intelligence and Analysis within the Department of the Treasury. The Office would be headed by a newly-appointed Assistant Secretary for Intelligence and Analysis appointed by the President and confirmed by the Senate. The Office would enhance the Department’s access to intelligence and permit a reorganization and upgrading of the scope and capacities of Treasury’s intelligence functions in light of the nation’s counterterrorist and economic sanctions programs. This section was drafted with bipartisan participation and close coordination with the Department of the Treasury.

The particular terms governing the new office are important to me as chairman of the Committee on Banking, Housing and Urban Affairs. The Office is to be headed by a newly authorized Assistant Secretary for Intelligence and Analysis appointed by the President and confirmed by the Senate. It will enhance the Department’s access to intelligence community information and permit a reorganization and upgrading of the scope and capacities of Treasury’s intelligence functions in light of the nation’s counterterrorist and economic sanctions programs. This section was drafted with bipartisan participation and close coordination with the Department of the Treasury.

your House colleagues to make sure the Treasury Department meets the Congress’ expectations. An identical letter has also been sent to Senator Sarbanes.

If there is anything that I can do to be of assistance to you, please do not hesitate to contact me.

Sincerely,

John W. Snow

Mr. ROBERTS. Mr. President, I ask that the Chair put the question to the body.

The PRESIDING OFFICER. Is there further debate?

If no further debate is ordered, the question is on agreeing to the conference report.

The conference report was agreed to.

MORNING BUSINESS

Mr. ROBERTS. Mr. President, I ask unanimous consent that there now be a period for morning business, with Senator permitted to speak therein for up to 10 minutes each.

The PRESIDING OFFICER. Without objection it is so ordered.

Who seeks recognition?

Mr. CHAMBLISS. Mr. President, I suggest the absence of a quorum.

The PRESIDING OFFICER. The clerk will call the roll.

The legislative clerk proceeded to call the roll.

Mr. REED. Mr. President, we have just concluded a cloture vote which is about to come to a final vote in Congress: The conference report was agreed to.

ENERGY POLICY ACT

Mr. REED. Mr. President, we have just concluded a cloture vote which will give us the opportunity to look more carefully at the Energy bill that is before the Senate. I believe such a careful and thorough review of the bill is entirely warranted. Indeed, it is not just my opinion but the opinion of countless numbers of Americans and also countless numbers of opinion leaders throughout the country.

These are a sample of some of the editorials that have appeared with respect to the Energy bill. The Washington Post calls the bill “depleted energy.” The New York Times says “a shortage of energy.” The Atlanta Journal-Constitution directs: “Put back-room energy bill out of the country’s misery.” The Houston Chronicle: “Fix the flaws—this proposed energy bill is half a loaf, half baked.”

The American people deserve good national energy policy, created through an open and democratic process. Sadly, the legislation before the Senate is not such a policy nor has it been achieved through an open and transparent and collaborative process. The Energy bill was crafted behind closed doors by members of one political party who chose to involve industry but not elected Senators and Congressmen. It looks as if the industry got the bill they wanted.

We have been told “take it or leave it.” I hope we can leave this bill behind. I hope this cloture vote signifies such a development.

If we leave it behind, one of the salient aspects of the Energy bill presented to Members is that it does not leave any lobbyist behind. In fact, to borrow a statement from my colleague from Arizona, this bill, indeed, leaves no lobbyist behind.

There is an Archer Daniels Midland ethanol provision adding $5.5 billion to gas prices over each of the next 5 years while cutting $2 billion a year from the highly vulnerable farmers to me to be implausible, indeed irrational, that we would enhance an industry while at the same time depriving our local cities and towns and States of the money they need to maintain the roads and bridges of America.

According to the Denver Post, there is $180 million to pay for development projects in Shreveport, LA, including the city’s first ever Hooters restaurant. I am not sure how that will help our energy policy.

Let’s not forget the $2 billion that taxpayers bear to clean up the mess left by MTBE producers. As the Wall Street Journal wrote:

We’ll say this for the energy bill that is about to final vote in Congress: It’s certainly comprehensive. It may not have all that much to do with energy anymore, but it does give something to every last elected Representative.

This bill utterly fails to establish an energy policy for the 21st century. It does nothing to address our country’s dependence on foreign oil, an issue I will discuss at length in a few minutes. In addition, it contains so many provisions that will hurt consumers and damage the environment that it is impossible to list them all. Here are just a few:

The bill doubles the use of ethanol in gasoline, which will drive up gasoline prices and deny valuable revenue to fix our roads and bridges.

The bill fails to make the reforms necessary to modernize our electricity grid and enhance reliability by providing a standard set of rules for our electricity markets. These rules would have provided greater efficiencies, greater reliability, and reasonably priced electricity that our homes and businesses need.

The bill increases air pollution by delaying rules to control mercury and other toxic pollutants emitted into the air and water.

The bill increases water pollution by exempting oil and gas exploration and production activities from the Clean Water Act storm water program.

The bill allows drilling off our coastlines by diminishing States’ rights to review offshore oil development projects and other proposed Federal activities to determine if the projects are consistent with the State coastal management plans.

The bill threatens our national security by failing to reduce the Nation’s dependence on foreign oil and providing billions of dollars in subsidies to build new nuclear powerplants. And the list goes on and on and on.

The American public deserves an economically sound Energy bill that will strengthen our economy and create good-paying jobs for Americans. But that is not this Energy bill.

This Energy bill is business as usual. It is a special interest grab bag cloaked in the rhetoric that it would create jobs and spur the economy. The cost of the entire bill is estimated to exceed $20 billion, more than $20,000 for each job that the author claims the bill will create. With the tax breaks alone costing American taxpayers over $25 billion, this bill adds to the deficit and further reduces spending for vital programs, such as education, health care, and water infrastructure.

The American public also deserve an environmentally friendly Energy bill that will protect our air and water and reduce greenhouse gases. But that is not this Energy bill.

This Energy bill will endanger the public’s health by allowing the energy industry to increase the pollution it emits into the air and water and limiting environmental review of energy projects.

One of the most egregious giveaways to corporations, at the expense of the environment and public health, is the product liability protection for MTBE. MTBE is known to cause serious damage to water quality nationwide. This immunity provision—which is retroactive to September 5, 2003, before virtually all the recent lawsuits involving MTBE—would shift $29 billion in cleanup costs from polluting corporations to taxpayers and water customers.

My State of Rhode Island and our residents are all too familiar with the dangers of MTBE. After MTBE leaked from an underground storage tank at a gas station and found its way into the water system of the Pascoag Utility in Burrillville by the summer of 2001, more than 1,200 families were forced to use bottled water for drinking, cooking, and food preparation for several months. Subsequent tests showed MTBE at such high levels that the State department of health recommended residents reduce shower and bath times and ventilate bathrooms with exhaust or window fans. Fortunately, Pascoag’s lawsuit against ExxonMobil to pay for the cleanup was filed before the September 5, 2003, cutoff date, but many other suits filed on behalf of residents in New Hampshire and other States will be thrown out by this bill. That, to me, is a tragedy.

The American people deserve a meaningful Energy bill that will ensure our national security by ending our dependence on foreign oil, diversifying our energy resources, and increasing our Nation’s energy efficiency. But that is not this Energy bill.

This Energy bill perpetuates the failed policies of the past 30 years, focusing almost exclusively on squeezing what little domestic energy production
